NATIONAL CANCER INSTITUTE MONOGRAPHS

Vincent T. DeVita, Jr., Director, *National Cancer Institute*

The Editorial Board welcomes proposals for the publication of monographs. The subject matter must be relevant to cancer research, have long-term interest, appeal to a wide readership, and be of quality meeting the standards of the *Journal of the National Cancer Institute*. Most monographs report the proceedings of conferences. Proposals should be sent to the Editor in Chief as early as possible, preferably several months before a conference (for conference proceedings) or before preparation of a final draft (for other monographs).

The Board of Editors does not review manuscripts for the Monograph Series. However, the Board may request scientific review of specific papers or sections in a proposed monograph, or it may seek advice on whether the proposed monograph meets the criteria mentioned above.

BOARD OF EDITORS

Peter Greenwald, *Editor in Chief*

Elizabeth K. Weisburger, *Assistant Editor in Chief*

Stuart A. Aaronson, *Associate Editor*

ACKNOWLEDGMENTS

With this report, we recognize the vision and the efforts of the cancer committees; the cooperation of physicians, hospital tumor registrars, medical record librarians, and hospital administrators; the guidance of CTR directors; the dedication of CTR research statisticians, analysts, field staff, coders, and other CTR personnel; the longtime support of the Connecticut State Medical Society Cancer Coordinating Committee; The Tumor Registry Association of Connecticut; the American Cancer Society, Connecticut Division, Inc.; the Connecticut State Department of Health Services; the National Cancer Institute; and the staffs of the Yale University and University of Connecticut Schools of Medicine.

Particular appreciation is due to Lawrence Hally, senior programmer of CTR, who provided the data processing and computer programming assistance for the tables. Special thanks go to Madeline Shea, CTR research statistician, retired, for her tutelage in the codes and coding practices at CTR.

We acknowledge the support for the CTR by Dr. Douglas Lloyd, Connecticut Department of Health Services Director.

We thank the following former and present staff members for their direct assistance with the production of this report: Bernadette Viccione, Constance Adachi, Cynthia Palmieri, Randell Grenier, typists; Dr. James Antognini, former senior program analyst; Dr. Norman Thetford, former senior systems analyst; Rosemary Serra, programmer; Gregory Morgan, programming assistant; Maria Schymura, Elizabeth Hatch, associates in research; Paul D. Sullivan, CTR research analyst; Robert Odell, Connecticut State Department of Health Services Division of Public Health Statistics, demographer, retired; and Dr. Mary G. McCrea Curnen, CCEU Director, for her editorial suggestions. We thank Robin Kneubuhl, assistant to the CCEU director, for the early recommendation of this project and her continuing administrative support.

Our gratitude is also extended to David Campbell, David Roney, and Kristin Torbet of Information Management Services, Inc., Rockville, Maryland, for their computer programming and electronic processing services for text and tables.

 SUMMARY TABLES	
Summary Table 1.—Number of primary neoplasms diagnosed in Connecticut residents, 1935-79	32
Summary Table 2.—Number and percent distribution of newly diagnosed cases of malignant neoplasms by period of diagnosis and sex, all sites, Connecticut, 1935-79	34
Summary Table 3.—Number, percent distribution, and male-to-female ratio of malignant, in situ, and other selected cases by primary site and sex, all years, Connecticut, 1935-79	35
Summary Table 4.—Percent distribution of newly diagnosed cases of malignant neoplasms by primary site and sex, all years, Connecticut, 1935-79	38
Summary Table 5.—Number of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy by primary site, sex, and year of diagnosis, Connecticut, 1935-79	40
Summary Table 6.—Average annual age-adjusted (1950 U.S. Standard) incidence rates of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy per 100,000 population by primary site, sex, and year of diagnosis, Connecticut, 1935-79	44
Summary Table 7.—Average annual age-adjusted (1970 U.S. Standard) incidence rates of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy per 100,000 population by primary site, sex, and year of diagnosis, Connecticut, 1935-79	48
Summary Table 8.—Average annual age-adjusted (World Standard) incidence rates of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy per 100,000 population by primary site, sex, and year of diagnosis, Connecticut, 1935-79	52
Summary Table 9.—Cumulative incidence rates of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy per 100 population (0-74 yr) by primary site, sex, and year of diagnosis, Connecticut, 1935-79	56
Summary Table 10.—Percentage of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy, confirmed histologically, by primary site, sex, and year of diagnosis, Connecticut, 1935-79	60
Summary Table 11.—Percentage of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy, registered from death certificate only, by primary site, sex, and year of diagnosis, Connecticut, 1935-79	64
Summary Table 12.—Percentage of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy, diagnosed first at autopsy, by primary site, sex, and year of diagnosis, Connecticut, 1935-79	68

Summary Table 13.—Number of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy by primary site, sex, age group, and median age at diagnosis, Connecticut, 1935–79	72
Summary Table 14.—Average annual crude and age-specific incidence rates of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy per 100,000 population by primary site, sex, and age group, Connecticut, 1935–79	80
Summary Table 15.—Percentage of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy, confirmed histologically, by primary site, sex, and age at diagnosis, Connecticut, 1935–79	88
Summary Table 16.—Percentage of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy, registered from death certificate only, by primary site, sex, and age at diagnosis, Connecticut, 1935–79	96
Summary Table 17.—Percentage of newly diagnosed cases of malignant neoplasms and selected neoplasms of benign and uncertain malignancy, diagnosed first at autopsy, by primary site, sex, and age at diagnosis, Connecticut, 1935–79	104

PRIMARY SITE TABLES

Malignant neoplasms of all sites except nonmelanomatous skin: ICD-O 140–172, 173: M-8720–8780, 174–199

Table 18A.—Number of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 140–172, 173: M-8720–8780, 174–199	113
Table 18B.—Number of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 140–172, 173: M-8720–8780, 174–199	113
Table 18C.—Number of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 140–172, 173: M-8720–8780, 174–199	114
Table 18D.—Number of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 140–172, 173: M-8720–8780, 174–199	115
Table 18E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of all sites except nonmelanomatous skin, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 140–172, 173: M-8720–8780, 174–199	116
Table 18F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of all sites except nonmelanomatous skin, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 140–172, 173: M-8720–8780, 174–199	116
Table 18G.—Percentage of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 140–172, 173: M-8720–8780, 174–199	117
Table 18H.—Percentage of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 140–172, 173: M-8720–8780, 174–199	117
Table 18I.—Percentage of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 140–172, 173: M-8720–8780, 174–199	118
Table 18J.—Percentage of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 140–172, 173: M-8720–8780, 174–199	118
Table 18K.—Percentage of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 140–172, 173: M-8720–8780, 174–199	119
Table 18L.—Percentage of newly diagnosed cases of malignant neoplasms of all sites except nonmelanomatous skin, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 140–172, 173: M-8720–8780, 174–199	119

Table 20I.—Percentage of newly diagnosed cases of malignant neoplasm of tongue, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 141.0–141.9	132
Table 20J.—Percentage of newly diagnosed cases of malignant neoplasm of tongue, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 141.0–141.9	132
Table 20K.—Percentage of newly diagnosed cases of malignant neoplasm of tongue, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 141.0–141.9	133
Table 20L.—Percentage of newly diagnosed cases of malignant neoplasm of tongue, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 141.0–141.9	133

Malignant neoplasms of major salivary glands: ICD-O 142.0-142.9

Table 21A.—Number of newly diagnosed cases of malignant neoplasms of major salivary glands, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 142.0–142.9	134
Table 21B.—Number of newly diagnosed cases of malignant neoplasms of major salivary glands, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 142.0–142.9	134
Table 21C.—Number of newly diagnosed cases of malignant neoplasms of major salivary glands, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 142.0–142.9	135
Table 21D.—Number of newly diagnosed cases of malignant neoplasms of major salivary glands, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 142.0–142.9	136
Table 21E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of major salivary glands, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 142.0–142.9	137
Table 21F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of major salivary glands, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 142.0–142.9	137
Table 21G.—Percentage of newly diagnosed cases of malignant neoplasms of major salivary glands, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 142.0–142.9	138
Table 21H.—Percentage of newly diagnosed cases of malignant neoplasms of major salivary glands, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 142.0–142.9	138
Table 21I.—Percentage of newly diagnosed cases of malignant neoplasms of major salivary glands, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 142.0–142.9	139
Table 21J.—Percentage of newly diagnosed cases of malignant neoplasms of major salivary glands, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 142.0–142.9	139
Table 21K.—Percentage of newly diagnosed cases of malignant neoplasms of major salivary glands, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 142.0–142.9	140
Table 21L.—Percentage of newly diagnosed cases of malignant neoplasms of major salivary glands, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 142.0–142.9	140

Malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth: ICD-O 143.0-145.9

Table 22A.—Number of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 143.0–145.9	141
Table 22B.—Number of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 143.0–145.9	141
Table 22C.—Number of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 143.0–145.9	142
Table 22D.—Number of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 143.0–145.9	143
Table 22E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 143.0–145.9	144
Table 22F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 143.0–145.9	144

Table 22G.—Percentage of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 143.0–145.9	145
Table 22H.—Percentage of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 143.0–145.9	145
Table 22I.—Percentage of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 143.0–145.9	146
Table 22J.—Percentage of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 143.0–145.9	146
Table 22K.—Percentage of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 143.0–145.9	147
Table 22L.—Percentage of newly diagnosed cases of malignant neoplasms of gum, floor of mouth, other and unspecified parts of mouth, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 143.0–145.9	147

Malignant neoplasm of oropharynx: ICD-O 146.0–146.9

Table 23A.—Number of newly diagnosed cases of malignant neoplasm of oropharynx, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 146.0–146.9	148
Table 23B.—Number of newly diagnosed cases of malignant neoplasm of oropharynx, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 146.0–146.9	148
Table 23C.—Number of newly diagnosed cases of malignant neoplasm of oropharynx, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 146.0–146.9	149
Table 23D.—Number of newly diagnosed cases of malignant neoplasm of oropharynx, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 146.0–146.9	150
Table 23E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of oropharynx, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 146.0–146.9	151
Table 23F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of oropharynx, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 146.0–146.9	151
Table 23G.—Percentage of newly diagnosed cases of malignant neoplasm of oropharynx, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 146.0–146.9	152
Table 23H.—Percentage of newly diagnosed cases of malignant neoplasm of oropharynx, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 146.0–146.9	152
Table 23I.—Percentage of newly diagnosed cases of malignant neoplasm of oropharynx, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 146.0–146.9	153
Table 23J.—Percentage of newly diagnosed cases of malignant neoplasm of oropharynx, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 146.0–146.9	153
Table 23K.—Percentage of newly diagnosed cases of malignant neoplasm of oropharynx, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 146.0–146.9	154
Table 23L.—Percentage of newly diagnosed cases of malignant neoplasm of oropharynx, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 146.0–146.9	154

Malignant neoplasm of nasopharynx: ICD-O 147.0–147.9

Table 24A.—Number of newly diagnosed cases of malignant neoplasm of nasopharynx, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 147.0–147.9	155
Table 24B.—Number of newly diagnosed cases of malignant neoplasm of nasopharynx, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 147.0–147.9	155
Table 24C.—Number of newly diagnosed cases of malignant neoplasm of nasopharynx, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 147.0–147.9	156
Table 24D.—Number of newly diagnosed cases of malignant neoplasm of nasopharynx, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 147.0–147.9	157

Table 24E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of nasopharynx, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 147.0–147.9	158
Table 24F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of nasopharynx, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 147.0–147.9	158
Table 24G.—Percentage of newly diagnosed cases of malignant neoplasm of nasopharynx, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 147.0–147.9	159
Table 24H.—Percentage of newly diagnosed cases of malignant neoplasm of nasopharynx, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 147.0–147.9	159
Table 24I.—Percentage of newly diagnosed cases of malignant neoplasm of nasopharynx, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 147.0–147.9	160
Table 24J.—Percentage of newly diagnosed cases of malignant neoplasm of nasopharynx, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 147.0–147.9	160
Table 24K.—Percentage of newly diagnosed cases of malignant neoplasm of nasopharynx, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 147.0–147.9	161
Table 24L.—Percentage of newly diagnosed cases of malignant neoplasm of nasopharynx, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 147.0–147.9	161
Malignant neoplasm of hypopharynx: ICD-O 148.0–148.9	
Table 25A.—Number of newly diagnosed cases of malignant neoplasm of hypopharynx, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 148.0–148.9	162
Table 25B.—Number of newly diagnosed cases of malignant neoplasm of hypopharynx, by age group, median age, and year of diagnosis, Connecticut, females: ICD-O 148.0–148.9	162
Table 25C.—Number of newly diagnosed cases of malignant neoplasm of hypopharynx, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 148.0–148.9	163
Table 25D.—Number of newly diagnosed cases of malignant neoplasm of hypopharynx, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 148.0–148.9	164
Table 25E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of hypopharynx, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 148.0–148.9	165
Table 25F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of hypopharynx, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 148.0–148.9	165
Table 25G.—Percentage of newly diagnosed cases of malignant neoplasm of hypopharynx, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 148.0–148.9	166
Table 25H.—Percentage of newly diagnosed cases of malignant neoplasm of hypopharynx, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 148.0–148.9	166
Table 25I.—Percentage of newly diagnosed cases of malignant neoplasm of hypopharynx, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 148.0–148.9	167
Table 25J.—Percentage of newly diagnosed cases of malignant neoplasm of hypopharynx, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 148.0–148.9	167
Table 25K.—Percentage of newly diagnosed cases of malignant neoplasm of hypopharynx, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 148.0–148.9	168
Table 25L.—Percentage of newly diagnosed cases of malignant neoplasm of hypopharynx, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 148.0–148.9	168
Malignant neoplasms of pharynx NOS, and Waldeyer's ring: ICD-O 149.0, 149.1	
Table 26A.—Number of newly diagnosed cases of malignant neoplasms of pharynx NOS, and Waldeyer's ring, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 149.0, 149.1	169
Table 26B.—Number of newly diagnosed cases of malignant neoplasms of pharynx NOS, and Waldeyer's ring, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 149.0, 149.1	169
Table 26C.—Number of newly diagnosed cases of malignant neoplasms of pharynx NOS, and Waldeyer's ring, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 149.0, 149.1	170
Table 26D.—Number of newly diagnosed cases of malignant neoplasms of pharynx NOS, and Waldeyer's ring, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 149.0, 149.1	171

Table 32B.—Number of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.0, 153.1, 153.7	211
Table 32C.—Number of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.0, 153.1, 153.7	212
Table 32D.—Number of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.0, 153.1, 153.7	213
Table 32E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.0, 153.1, 153.7	214
Table 32F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.0, 153.1, 153.7	214
Table 32G.—Percentage of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.0, 153.1, 153.7	215
Table 32H.—Percentage of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.0, 153.1, 153.7	215
Table 32I.—Percentage of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.0, 153.1, 153.7	216
Table 32J.—Percentage of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.0, 153.1, 153.7	216
Table 32K.—Percentage of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.0, 153.1, 153.7	217
Table 32L.—Percentage of newly diagnosed cases of malignant neoplasms of transverse colon and hepatic and splenic flexures of colon, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.0, 153.1, 153.7	217
Malignant neoplasm of descending colon: ICD-O 153.2	
Table 33A.—Number of newly diagnosed cases at malignant neoplasm of descending colon, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.2	218
Table 33B.—Number of newly diagnosed cases of malignant neoplasm of descending colon, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.2	218
Table 33C.—Number of newly diagnosed cases of malignant neoplasm of descending colon, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.2	219

Table 33D.—Number of newly diagnosed cases of malignant neoplasm of descending colon, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.2	220
Table 33E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of descending colon, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.2	221
Table 33F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of descending colon, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.2	221
Table 33G.—Percentage of newly diagnosed cases of malignant neoplasm of descending colon, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.2	222
Table 33H.—Percentage of newly diagnosed cases of malignant neoplasm of descending colon, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.2	222
Table 33I.—Percentage of newly diagnosed cases of malignant neoplasm of descending colon, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.2	223
Table 33J.—Percentage of newly diagnosed cases of malignant neoplasm of descending colon, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.2	223
Table 33K.—Percentage of newly diagnosed cases of malignant neoplasm of descending colon, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.2	224
Table 33L.—Percentage of newly diagnosed cases of malignant neoplasm of descending colon, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.2	224

Malignant neoplasm of sigmoid colon: ICD-O 153.3

Table 34A.—Number of newly diagnosed cases of malignant neoplasm of sigmoid colon, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.3	225
Table 34B.—Number of newly diagnosed cases of malignant neoplasm of sigmoid colon, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.3	225
Table 34C.—Number of newly diagnosed cases of malignant neoplasm of sigmoid colon, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.3	226
Table 34D.—Number of newly diagnosed cases of malignant neoplasm of sigmoid colon, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.3	227
Table 34E.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of sigmoid colon, by year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.3	228
Table 34F.—Average annual age-specific incidence, crude, age-adjusted (1950, 1970 U.S. Standard, and World Standard) rates per 100,000 population and cumulative (ages 0–74 yr) rates per 100 population of malignant neoplasm of sigmoid colon, by year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.3	228
Table 34G.—Percentage of newly diagnosed cases of malignant neoplasm of sigmoid colon, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.3	229
Table 34H.—Percentage of newly diagnosed cases of malignant neoplasm of sigmoid colon, confirmed histologically, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.3	229
Table 34I.—Percentage of newly diagnosed cases of malignant neoplasm of sigmoid colon, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.3	230
Table 34J.—Percentage of newly diagnosed cases of malignant neoplasm of sigmoid colon, registered from death certificate only, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.3	230
Table 34K.—Percentage of newly diagnosed cases of malignant neoplasm of sigmoid colon, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.3	231
Table 34L.—Percentage of newly diagnosed cases of malignant neoplasm of sigmoid colon, diagnosed first at autopsy, by age group and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.3	231

Malignant neoplasms of ascending colon, cecum, and appendix: ICD-O 153.4–153.6

Table 35A.—Number of newly diagnosed cases of malignant neoplasms of ascending colon, cecum, and appendix, by age group, median age, and year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.4–153.6	232
Table 35B.—Number of newly diagnosed cases of malignant neoplasms of ascending colon, cecum, and appendix, by age group, median age, and year of diagnosis, Connecticut, 1935–79, females: ICD-O 153.4–153.6	232
Table 35C.—Number of newly diagnosed cases of malignant neoplasms of ascending colon, cecum, and appendix, by age group, median age, and single year of diagnosis, Connecticut, 1935–79, males: ICD-O 153.4–153.6	233

PREFACE

This report is intended to be a reference book on the number of cancer cases and the rates in the State of Connecticut from 1935 through 1979. The incidence frequencies and rates are provided on cases at "all sites" and for individual major sites by sex, age, and period of diagnosis. The tabulated variables were selected on the basis of their reliability and uniformity over the forty-five years and for their general usefulness. Indicators of the quality and completeness of registration are given: tables of percentages of cases that had been verified histologically and of cases registered first at autopsy and those registered by death certificate only. Factors that may have influenced registration are described in the text.

The Connecticut Tumor Registry is the source of the data. Operating within the Connecticut State Department of Health Services, under 1935 legislative authorization, the Registry has collected the reports of malignant neoplasms diagnosed in Connecticut residents and of some nonmalignant tumors of special medical interest. The primary source of the reports has been the hospitals of Connecticut. Until legislation in 1971 required cancer registration, reporting was voluntary. Some out-of-state hospitals have cooperated also. Cancer reported as a cause of death on the death certificate augmented the registration.

CONNECTICUT TUMOR REGISTRY IN PERSPECTIVE

Importance of the Connecticut Tumor Registry Data in the Study of Cancer

Cancer incidence experience in Connecticut for the 45 years 1935 through 1979 has been compiled from the CTR. At the beginning of 1980, the CTR contained information on 351,900 cases of malignant neoplasms and of certain nonmalignant tumors diagnosed in Connecticut residents from 1935. Based on a large, well-defined, state-wide population, the data provide a unique and valuable resource for assessment of the scope of the cancer problem for epidemiology studies. The CTR is both the oldest population-based registry in the world that has continuously collected data and provided follow-up on all types of cancer (1) and the largest in the United States (2). This Registry has provided a major source of incidence data used within the United States for many years (3) and has served as a model in the initiation of other cancer registries across the country (4).

National and International Use of Connecticut Tumor Registry Data

The CTR has been valued nationally and internationally as well as locally. Collaboration in the EREP of the NCI, begun in the late 1950s (2), continues as a part of the SEER Program of the NCI. The CTR also cooperated in international epidemiology studies and symposia. In the 1960s, the staff was engaged in cooperative studies with the population-based cancer registries of Denmark, Norway, and Finland (1) and presented papers significant in cancer epidemiology (5). At the Eighth International Cancer Congress in Moscow, Connecticut data were provided to the IARC and the International Association of Cancer Registries for their publications (6-8). Hundreds of physicians and research scientists [(8); Flannery JT: Personal communication] have used data from this Registry in their search for an understanding of cancer in its various forms and for its control.

Importance of Connecticut Tumor Registry Data in Epidemiology and Environmental Studies

In the systematic study of cancer, classic descriptive epidemiology remains a foundation stone. Determination of the extent of cancer within a population and its greater occurrence in any demographic segment are important approaches to the making of etiologic hypotheses as well as to health care planning and evaluation. It is important that these patterns of incidence be studied in a relatively unselected population of persons exposed to the risk within a well-defined geographic area of known population size and composition (9). Because of the large numbers of cases and the 45-year history, CTR data provide investigators with the opportunity to study the occurrence and distribution of cancer in the State in respect to many demographic, disease, diagnostic, and treatment variables. Comparisons of incidence patterns with those of other geographic areas, i.e., state, national, and international, have been useful in the estimation of environmental influences on cancer (10). In international studies, Connecticut represents a long-time urbanized, industrial, high income area (3).

Size and Stability of Population Base

Secular trends and cohort series are especially meaningful in a large and stable population. The population of Connecticut numbered 1,606,903 in 1930 and by 1980 had reached 3,107,576. The gains in population have occurred in each decade both by the excess of births over deaths and by positive net migration. The assessment of natural increase can be made accurately because the registration of births and deaths in Connecticut not only goes back over a century but also has been among the most complete in the nation (11). Because no record is made of the movement of individuals, net migration figures provide an indication of this additional factor in population change. The State has had as stable a population as the United States as a whole (11). In general, the State has not had a loss of population by net migration but a gain. Even in 1970, in this "age of mobility," 62% of Connecticut residents had been born in the State. Of those born elsewhere, most had moved in from the neighboring states with environments similar to Connecticut (12). The 1980 United States Census revealed that the net outmigration of Connecticut residents in the previous decade amounted to -1.8%.

¹ Supported in part by Public Health Service contracts N01-CP33235 and N01-CP61002 with the Division of Cancer Prevention and Control, National Cancer Institute.

Initiation of the Connecticut Tumor Registry

Optimism About Cancer Control

The stage was set for a positive and hopeful approach to cancer treatment with the burgeoning knowledge of tumor structure, pathology, lymphatic drainage, new surgical techniques, and the discovery of ionizing radiation and its use in the diagnosis and treatment of disease. "Ionizing radiation was applied meaningfully to cancer treatment by 1930, and the surgical procedures for cancer were extended" (13). In the late 1920s, the opinion of surgeons in the large hospitals, men who saw many more cases than the local practitioner, was that cancer could be treated with a good outcome, especially in the early stages (14). The belief that early recognition and treatment of cancer was the key to its control was accepted by Connecticut public health professionals and the Medical Society (15, 16). Because they believed it strongly enough to desire to demonstrate this for themselves and especially for the education of the public, they were instrumental in the formation of the CTR.

Recognition of Need for Cancer Registration

In Connecticut, the importance of a registry in cancer control was recognized early not only by medical and public health professionals but also by lay people. Simultaneous and cooperative efforts among various groups resulted in developmental studies, the formation of working committees, and in support and action on the state level (1, 8, 14). Recommendations by each of the respective cancer committees emphasized the need for an organized and ongoing statistical study of the extent of cancer in the population.

First Survey: Need for Cancer Statistics

A survey of the health facilities and needs of the city of New Haven, requested in 1926 by the New Haven Community Chest, revealed that cancer mortality rates in the State and particularly in New Haven were alarmingly high (14). The survey was conducted by Yale University public health personnel, and an administrative plan was outlined by a medical school physician. The first recommendation of the survey was to undertake "a continuing study of the statistical aspects of the cancer problem in New Haven" (14, 17).

Continued Study: Need for Better Statistics

The recommendations for a continued study were implemented by the organization of and community support for the Cancer Committee of New Haven. The study committee began its work in 1930 (16, 18). Their work of compiling the data from the 3 hospitals in New Haven initiated the design of uniform tumor records, instruction of hospital staff in record maintenance, education of hospital and community physicians in supplying good information, and the recognition of the necessity for follow-up of cancer patients. Follow-up was considered essential for the welfare of the patient; the record of the patient's survival provided an important measure of disease severity and results of therapy. In its final report in 1935, the commit-

tee urged the continued and improved compilation and analysis of cancer statistics to forward the primary purpose of cancer control by "promotion of means whereby the general public could be educated to recognize the early signs and symptoms of the disease to provide for early diagnosis" (16).

Legislative Authorization as a Result of Cooperative Effort

The physicians in this effort brought their concerns to the attention of the Connecticut State Medical Society, whose Council appointed a Tumor Study Committee in 1933 (14, 19) and adopted a resolution that was addressed to the statewide needs in cancer control (20). Working with physicians throughout the State, the Tumor Study Committee began planning for a statewide registry of hospitalized cancer patients (14). With the State Department of Health, the Medical Society sponsored a bill which was passed in the 1935 General Assembly and signed into law by the Governor. The State Department of Health was "authorized to make investigations concerning cancer, the prevention and treatment thereof, and the mortality therefrom, and to take such action as it may deem will assist in bringing about a reduction in the mortality due thereto." A State appropriation was made at the time and, in 1936, additional funds were appropriated by the federal Public Health Service to augment the work on cancer (21).

Organization of the Connecticut Tumor Registry

The Division of Cancer Research was set up within the State Health Department in 1935. Although the foremost concern was the lowering of morbidity and mortality due to cancer by education of citizen and physician alike in early diagnosis and treatment and by provision of tumor clinics to serve the people, the Director of the State Health Department also emphasized statistical studies by employing a research statistician and undertaking a pilot study (2).

With the support and guidance of physicians on the State Medical Society Tumor Committee, on hospital staffs, in the medical school, in associations of pathologists and radiologists, or in practice in communities, the program of cancer clinics and registration of cancer cases at the general hospitals expanded and became systematized under the Division of Cancer Research of the State Department of Health. In 1941, the statewide Central Cancer Registry (now called the "Connecticut Tumor Registry") was established (14, 22). The early developmental history of the Connecticut Cancer Control Program and the Registry is quite remarkable in the voluntary, cooperative, and statewide organization of so many sectors of the health care community and in the acceptance of interlacing responsibilities by professional and voluntary groups.

Continuation of the Goals of Cancer Registration

Cancer registration was established to serve the ultimate goal of the control of cancer. The immediate aims of cancer registration delineated by the initiators of the CTR remain essentially the basis of its endeavors and those of

other registries today (23). Echoes of the Connecticut Cancer Committee reports of the 1930s may be heard in the statement of the UICC concerning the case for a cancer registry:

“Information may be required on cancer in a population 1) to describe the nature and extent of the malignant disease experienced; 2) to study etiology; 3) to assist in control and prevention; 4) to assess the efficacy of treatment; 5) to evaluate the quality of survival; 6) to provide for a basis for education” (24).

PUBLICATION OF BASIC CONNECTICUT TUMOR REGISTRY DATA

Monograph Series

The CTR was established as a means of providing important information about the extent of cancer in the State population. In the past, basic data were made available in a series of monographs as illustrated in text-table 1 (25-38). Annually, incidence and mortality were published in an issue of the *Connecticut Health Bulletin*; 1972 data were the last issued in 1974 (text-table 2). Connecticut age-adjusted rates for 16 major site titles for 1973-76 have been included in the SEER Program publication (46). Tables of Connecticut incidence for 95 site and type categories of malignant tumors and 17 sites for in situ tumors are presented in (47). Individual researchers have published well over 200 articles using CTR information.

Forty-five Year Incidence Report

The incidence of cancer registered in the CTR for 1935-79 is presented here to the physicians, epidemiologists, planners, and other cancer researchers of today in the tradition of those concerned and foresighted people who worked together in the past to establish and conduct the central State registration. To maximize the utility of the data, we have presented the information for an exten-

sive list of primary site and neoplasm types, by sex, year of diagnosis, and 5-year age groups. Items affecting the use and comparability of the data both internally and with other systems, such as methods and problems of registration, classification of primary site, expansion and contraction of site title codes, and population bases, are discussed in the following sections.

HISTORY OF CONNECTICUT TUMOR REGISTRATION

Influence of Registration Methods on the Data

The history of registration of cancer for the State must be considered because of its impact on the type and quality of the data recorded in each period. At the beginning, CTR staff's stated aims were to determine the incidence and mortality of cancer in Connecticut, describe the distribution of cases, and evaluate the end results of treatment. Follow-up of patients was considered of primary importance in the promotion of their continued medical supervision, in addition to being essential to survival analysis (27). The emphasis placed on each of these aims varied with the time and current influences.

Fundamental Requirements for Cancer Registration

The fundamental requirements for cancer registries to achieve their aims with good and comparable data are summarized as follows: 1) complete registration; 2) prevention of duplication; 3) collection of uniform data, i.e., standardization of items registered, definitions, rules, classification and nomenclature of site and histology, staging, and procedures; 4) quality control; and 5) efficient data processing (23). These fundamentals have always been recognized at the CTR as basic, but their formal structuring and documentation has had to increase with the size of the registration task and of the staff.

Impact of Contemporary Practices

The user of the data should be aware of concomitant influences on the diagnosis and reporting of cancer cases, such as: 1) contemporary medical practices, 2) available diagnostic techniques, 3) changing knowledge of the pathology of the disease, 4) possibilities of treatment, and 5) probabilities of survival. The layman's view of cancer and its medical care at any particular time influences whether and where the person seeks medical attention and whether he/she is willing to undergo diagnostic testing or surgery and accept treatment. These factors influence

whether and when a case is registered. The medical knowledge and techniques of the day play an extremely important role in the detection of a cancer, the accurate diagnosis of site, the assignment of histologic type, the stage at diagnosis, as well as in the treatment and survival of the patient.

Retrospective Registration: 1935-41

Standardization of Tumor Records and Procedures

In 1941, the Connecticut Cancer Record Registry, as the CTR was first called, went into statewide operation within the Division of Cancer Research of the State Department of Health. The chief effort in this division during the first years, 1935-40, was the establishment of both tumor clinics and registries in local hospitals; basic to these tasks was the education of the public and the professionals (8). A standard tumor record form and a follow-up record were developed for the cooperating hospitals so that hospital records could be abstracted. The original would remain in the hospital registry and a copy would be sent to the State Registry (48, 49).

Completeness of Registration: Nonduplication

Beginning in 1941, the case histories of all cancer patients admitted to any general hospital after January 1, 1935, were abstracted by the research statistician and trained clerks sent by the central registry. Records for outpatients and nonhospitalized cancer patients known through pathology laboratories and radiology departments of the hospitals were also abstracted (48, 49). As this was done, hospital tumor registry personnel were instructed and encouraged in the task of obtaining uniformly complete data. They took great care to exclude any case diagnosed before 1935. To prevent duplication of case records, the statistician cross-indexed and checked files. In this manner, first and subsequent admissions for care of a particular tumor patient could be differentiated (50). The death certificate files of the State Bureau of Vital Statistics yielded the fact of death among patients whose cases were abstracted. In addition, the record of cancer on a death certificate added previously unreported cases to the Registry file. When the hospital record was incomplete or puzzling, the statistician checked with the hospital physician or pathologist. Some records were obtained "through reciprocal arrangements with physicians, health departments, and hospitals in 41 states" (49).

At the request of the Connecticut State Medical Society, cases of certain benign neoplasms were registered in addition to all malignant neoplasms: 1) all neoplasms of the brain and pituitary gland, 2) papillomas of the urinary bladder, 3) carcinoids of the appendix, and 4) salivary gland mixed tumors (27).

Follow-up

Follow-up was an essential part of the plan for cancer control. The Tumor Committee of the State Medical Society was eager to get cancer patients into competent medical hands in the early stage of disease and also to

provide continued supervision. The hospital-based tumor clinics, staffed by well-qualified physicians, were available to those who did not have a private physician (15). During 1935 to 1941, the staff at the Tumor Registry made a concerted effort through hospitals and clinics to find patients presumed alive but lost to follow-up. Many patients had private physicians from whom permission to try to contact the patients was obtained by hospital personnel (50, 51). In this period, 1,500 patients who had been presumed dead were found to be living. "It was dramatic. Funds were forthcoming and the pioneer follow-up program in the United States was under way" (Macdonald EJ: Personal communication).

First Period of Tumor Record Submission by Hospitals: 1942-48

After the initial period during which the State Tumor Registry team searched and abstracted the case data, the tumor records were sent regularly by the 10 hospital tumor clinic secretaries to the State Registry. As additional hospitals joined the system, the CTR team abstracted case histories back to the 1935 diagnoses, and each tumor clinic secretary was instructed in standard reporting procedures (2, 27).

Data Elements Registered

During the first period of registration, 1935-38, the recorded data elements included age, sex, nationality, color, town and county of residence, marital status, occupation at time of hospital admission, red and white blood cell counts, serology, primary or secondary admission, reporting hospital, method of diagnostic confirmation, duration of symptoms, general condition of patient on admission, treatment, vital status, family history of cancer, autopsy, as well as tumor specifics such as site, histology, stage, and grade (50). A comparison of this list to the data elements coded in 1979 reveals the change in medical concerns. For each case, a paper file was started and, for quick machine sorting, 3 decks of 52-column index punch cards of identifying information by site, year, and reporting hospital were created. Follow-up information was maintained both in the paper file on the patient and on an index card file (50). Essentially, the management of the data file was manual.

Promotion of Good Registration by Hospitals

The funds granted by the State to the CTR were allocated to the cooperating hospitals on the basis of a point system. Points were earned by the hospital for each 1) patient in attendance; 2) diagnostic x ray, 3) microscopic specimen; 4) medical history record; 5) pathology report, and 6) report including information on follow-up, duration of symptoms, or delay in seeking treatment. The hospital received a portion of the total funds in proportion to the points earned. This method encouraged improvement of records and, more importantly, fostered better services and follow-up for patients. In the first year of operation, 1940-41, the percentages of items earning points increased.

For example, recording of case histories rose from 93 to 98% of all cases, and microscopic confirmation of cancers went from 74 to 79% (52). The CTR continued to allocate funds to the hospitals by the point method until 1979.

End of the First Period of Registration

During the first period of registration (1935–48), despite the problems of personnel shortages and dislocation of people during World War II, cancer registration was established in Connecticut and was improving in completeness and reliability. “A method of reporting has been evolved without recourse to regulation, with no personal inconvenience to physician or patient, and incidental to the establishment of this registry. . . . As a direct result of this concerted effort, individuals with cancer are reporting regularly to their physician or hospital for verification of their state of health.”

“By such a simple plan of coordinated effort of physician, hospital, health department, and layman, information contained in records lying in separate hospital files is now becoming available in the central file for massed statistical appraisal and in the local hospital files for statistical presentation of clinical data” (48).

Increasing Hospital Participation and Completeness and Reliability of Registration, 1941–79

The magnitude and completeness of registration continued to increase as hospitals came into the system throughout the next 30 years. In 1941, the 21 general hospitals that reported cancer cases to the CTR represented 90% of all general hospital beds. The 8 small hospitals not in the reporting system were in rural towns with populations below 10,000 in 1941 and had a minimal effect on registration (Hatch EE: Unpublished observations). By 1943, 26 hospitals, representing 92% of the approved general hospital beds in the State, were registering their new cases (52). In 1950, 28 hospitals, representing 93% of general hospital beds, were cooperating. At this time, of the 83% of new cases reported by the hospitals, 86% had been “microscopically confirmed” (26, 27).

Registrars of 30 of the 37 licensed general hospitals were reporting cases in 1954, as were 3 out-of-state hospitals. Ninety-four percent of the beds were represented by these Connecticut hospitals (5, 27). Eisenberg reported in the 1960 CTR Monograph (29) that the small private hospitals not routinely reporting cancer cases were visited periodically by CTR personnel who abstracted the necessary information. State and federal hospitals also reported cancer cases (30). In 1967, the CTR reported that all non-profit, private, and state hospitals registered their new cases (53). Reporting by hospitals was up to 97% of all registrations by 1965 (54) and was considered nearly complete (53, 55). However, we know that registration of cases from the 2 Veterans Administration hospitals, which opened in the mid-1950s, was not complete because many cases were registered first from death certificates. The CTR field staff then sought information from the physician and hospital recorded on the death certificate. Not

until the late 1960s did the CTR field staff go the Veterans Administration hospitals on a regular schedule to abstract cases. Until 1970, the CTR staff also went into 2 small community hospitals, which were not part of the reporting system, to do abstracting of cases. All general hospitals in Connecticut were voluntarily reporting their cancer cases by 1970 (Flannery JT: Personal communication). A law requiring reporting of cancer cases to the CTR by all types of hospitals became effective in 1971 and gave a legal voucher for registration, which for 30 years had been achieved through voluntary, cooperative efforts (2).

The proportion of cases reported to the CTR by out-of-state hospitals has been stable for 4 decades. A check of the CTR 1935–79 data tape showed that, in 1940–49, 3.1% of hospital-reported cases were from out-of-state hospitals, 2.8% in the 1950s, 3.0% in the 1960s, and 2.7% in the 1970s. These facts do not indicate a problem of under-reporting as a result of lack of participation by out-of-state hospitals (Hatch EE: Unpublished observations).

Growth in hospital participation and completeness of registration was reflected by the downward trend in the number of cancer cases registered first and only from death certificate information. Such cases represented 34.9% of all new cases in Connecticut in 1935–39, but by 1940–44, they represented 25.2%. During subsequent years, the number of DCO cases fell from 17.5% in 1945–49, 13.8% in 1950–54, 10.8% in 1955–59, to 2% by 1968–72 [table 11 of (7)]. In 1975–79, only 1.2% were DCO cases. Although these decreasing percentages are commonly interpreted as indicating the increasing reliability of registration (7), to those early proponents of a state registry the increasing registration of cases by hospitals would undoubtedly be a satisfying measure of the success of their hopes and efforts in public education toward seeking early hospital care of cancer patients (15, 56) and a measure of the underlying changes in the attitudes toward cancer of both layman and physician.

Changes in Connecticut Tumor Registry Procedures: 1949–56

Increase in Standardization of Registration

The growing load of registered cancer cases and the annually increasing volume of new cases and follow-up called for a reevaluation of the procedures of the Registry. The initial personnel had left the CTR and, after a slight hiatus, a new and larger staff had been employed. As a result of the break in staff continuity, some uncertainty existed concerning the punch card decks; therefore, the new staff recoded the whole Registry file of about 75,000 records between 1949 and 1952. A general reorganization was instituted in 1950: 1) realignment of staff duties; 2) delineation of coding procedures and rules; 3) design of a new tumor record form and coding sheet; 4) adoption of the new codes for primary site and histology; and 5) annual updating of vital status facts and survival on the keypunch card so that the labor involved in survival analysis was decreased (27).

Uniformity of data was maintained with the use of a code manual which standardized definitions and rules. Regular supervision and training for the particular staff

assigned to coding supported the control of uniformity (27).

Completeness of Registration, Nonduplication, Expansion, and Mechanization

Cancer records for Connecticut residents were sent to CTR by 30 of the 37 general hospitals, 3 out-of-state hospitals, and other agencies also out-of-state during the 1949–56 period. Through several routine procedures, each report was carefully checked for possible match to a previously reported individual or to a previously diagnosed tumor in an individual (27).

Several items that had been abstracted previously were no longer routinely recorded: nationality, color, occupation, blood count, duration of symptoms prior to diagnosis, condition at admission, and family history of cancer. Many new elements now were coded, among which were hospital status, second and third hospitals, days hospitalized, class of case, intent of treatment, metastatic sites, and condition at discharge. From the 76-column code sheet, a business machine card was punched. Follow-up data were posted on punch cards annually. A large amount of data could be tabulated, as required, with the use of mechanical sorters that eased the task of annual statistical analyses. Copies of the cards were sent to the NCI for mechanical calculation of survival.

The proportion of registered DCO cases had decreased to 17% in 1947–51 (27). The drop was ascribed to the fact that more people were going to the hospital for treatment because of the improved economy and increased optimism about cancer treatment. During 1950–56, few follow-back queries to the hospitals were made on death certificate cases (57). Not until 1957 did the Registry institute a greater effort to contact hospitals, institutions, and physicians for better information on these death certificate-reported cases (53).

Growing Optimism About Cancer Treatment

The immediate postwar years brought new optimism about cancer treatment. It was an era of widespread use of antibiotics, improved surgical methods (especially supportive measures), and new radiotherapeutic procedures. Compared with the previous decade, studies of Connecticut data for 1950–56 indicated good gains in survival rates for patients with cancers at many of the major sites. The proportions of patients whose diagnoses were microscopically confirmed had grown substantially (58).

In 1956, the American College of Surgeons had begun to require that general hospitals maintain a well-organized, up-to-date cancer registry as a condition for approval. Since 1961, hospitals approved by the American College of Surgeons have been required to submit a report of the end results of treatment of their cancer patients (53). These developments indicated a climate of increasing optimism about the treatment of cancer and of growing activity in the field. They were accompanied by improvements in the completeness, promptness, and quality of cancer registration.

Affiliation with the End Results Evaluation Program, National Cancer Institute: 1957–67

Need for Comparability of National Data

The Symposium on End Results in the Treatment of Cancer at the Third National Cancer Conference, held in June 1956, accentuated the need for coordination among registries. The comparability of data presented by various registries, hospitals, and physicians had been questioned because of the differences in definition of terms, selection of patients, procedures, and in follow-up policies (59). At the same time, the principal investigators in the expanding cancer chemotherapy research program requested cooperation in an evaluation of the end results of various treatments for cancer. Pooled data would be particularly necessary for studies of the tumors that occur infrequently. The NCI proffered support to registries in the United States through contracts and with technical and administrative assistance from its research program staff (8, 59, 60). Endorsed by the leading organizations in cancer research and control (the American Cancer Society, American College of Radiology, American College of Surgeons, Association of Tumor Clinic Registrars, and the College of American Pathologists), the proposed program was accepted by the registries (8). The CTR joined the registries of California, Massachusetts, and 9 teaching hospitals in accepting NCI contracts to submit specified cancer data each year. At a series of working group meetings, agreement was reached on the definitions, codes, and the format of the punch cards on which case data were to be submitted to the ERG. A UPC code was to be used for the information on patient diagnosis, treatment, and follow-up that would incorporate a primary site code based on the Seventh Revision of the ICD (61). Extended quality control programs were instituted at CTR and at NCI (55, 59).

Conversion to a Compatible System for the End Results Group

In preparation for the establishment of the new classification of cancer, the CTR in 1957 expanded the Connecticut primary site code to be compatible with the UPC code, and the 1960 CTR code was the result (62). Conversion of all previously registered cases to this new code at which everyone worked was the major task at this time. During the changeover period, only new cases were registered due to the pressures of manual recoding in an understaffed registry. Hospital staffs had been requested to submit only brief records. Follow-up and field work were minimal during this period. As a result, all the possible details on tumors and patients could neither be acquired nor filled in at later review (Shea M: Personal communication). Both the problems of change in code and the exigency of this task resulted in a greater proportion of tumors at a major site being classified in the NOS subsite category.

Additional types of data were collected and coded when the national collaborative effort began, and some redefinition of previously collected data occurred. In 1957, a dozen new data elements were added to the punch card, e.g., race, blood type, days of hospitalization, mention of cancer on the death certificate, an expanded treatment

field, supportive treatment, and treatment of recurrence. To record all these elements, the CTR put into operation in 1963 an extended code compatible with that of the UPC. The data cards were converted mechanically to the UPC code; one deck was prepared for the ERG. Not until 1962 was the first data deck under the ERG program submitted to the NCI (63), followed by others every 2 years thereafter. Approximately 60 boxes of cards were edited at NCI, and a tape of the data was sent to the CTR. The data on this UPC tape were not retrievable at the CTR, however, where operations, programs, and equipment were still card oriented (Flannery JT: Personal communication).

Increased Mechanization of Data Processing and Quality Control

After the affiliation with the NCI and receipt of additional financial support, the CTR acquired a large number of electronic data processing machines (keypunch machines, collator, sorter, lister), which enabled the addition of a punch card follow-up system. A special computer program was developed so that coding errors could be checked. With this electronic equipment, CTR was able to do survival analyses (8). The equipment also made possible more rapid availability of the ever-increasing data to Connecticut physicians and hospitals and use in national and international studies as well (63).

The mechanics and operation of the registration system during this period have been detailed in several papers by Registry staff members. They affirmed the principles of sound registration, and they outlined the many control procedures designed to expand and check registration (63-66).

Research Studies in Quality Control

Research studies expanded the checking of the abstracting process and of the registered data beyond the routine quality controls. For example, special studies of cancer of the uterine cervix and corpus had been performed in the CTR in the late 1950s. The registration information on cases accessed during 1935-51 was checked against hospital records for accuracy of site, histology, age, year of diagnosis, stage, extent of disease, and treatment. The reporting was judged complete and accurate except for extent of disease. It was also determined, specifically, that in most instances when physicians reported only "cancer of the uterus," they meant "cancer of the uterine corpus" (67, 68).

International Collaborative Studies

Eighth International Cancer Congress

The international activities of the NCI had a direct effect on the CTR and its development because the CTR staff was substantially involved in the planning stages and on working committees. In 1959, at the invitation of the NCI, representatives of 5 national registries, i.e., Denmark, Norway, Finland, France, England and Wales, met with the NCI committees to consider international collaborative studies. An ad hoc group on international coop-

eration in "evaluation of end results" was formed to work out details. At first, there was an exchange of visits among the registries and a few months later the whole group met. Areas of agreement and disagreement in the reporting of cancer were identified. The group examined problems of definition, nomenclature, and statistical interpretation of data, and developed a set of rules and definitions for reporting and compiling the collaborative data. The committee planned for studies on 14 sites that would be presented at the Eighth International Cancer Congress in 1962 (5, 59).

The Eighth Congress met in Moscow in July 1962, but reports on only 4 sites (tongue, colon, breast, testis) and leukemia could be presented. The usefulness and significance of such cooperative ventures were substantiated, especially for epidemiology studies. Demonstrated differences between countries in cancer incidence and in survival at some sites were suggestive of new approaches to the study of cancer (1). At the Congress, further plans were made for continuation of the collaborative work, and a symposium on end results was scheduled for the following year. The NCI continued to act not only in the capacity of a stimulator and participant, but also as a material supporter of these efforts.

International Symposium on End Results of Cancer Therapy

The International Symposium on End Results of Cancer Therapy was held in Norway in September 1963. Six nations contributed data for 12 primary cancer sites and leukemia. Heavy reliance was placed on CTR data because they were population based and considered to be nearly complete (1, 5, 8). Connecticut data were presented as part of the combined United States data and separately. In the introduction to the symposium, Cutler stated that "the Connecticut registry contains information on virtually every case of cancer diagnosed among residents of the State" (59).

Effects of Collaborative Studies on Registration

The considerable participation of the CTR in the national and international studies pointed up problems in registration procedures in Connecticut and led to their improved quality (8). Records were extensively reviewed in preparation for the studies. For leukemia and cancer sites designated for study, cases were checked for coding accuracy and comparability: tongue, esophagus, lung, uterine cervix and corpus, breast, ovary, prostate, stomach, colon, and rectum (Shea M: Personal communication). This process functioned as an additional quality control mechanism. Problems of comparability of the international data emphasized the importance of clear definitions and common classification systems. Problems which arose in comparisons of data from the several countries were in the following areas: 1) microscopically unconfirmed cases; 2) DCO cases; 3) unstaged cases; 4) inadequate number of age groups in tabulations; 5) computations of survival time; and 6) definitions of treatment, stage of disease, and content of primary site title (57). For example, differences among data for colon cancer between 1953 and 1958 from the Norwegian and Connecticut regis-

tries indicated the need for greater follow-back in death certificate-reported cases in Connecticut (69). For that period, only 1% of Norway's cases were reported by DCO, whereas in Connecticut, such registrations were 18% of the total. Dissimilar registration and follow-back practices produced this difference. In Norway, reports were required from all hospitals, pathology institutes, and radiology departments, which meant some nonhospitalized cases were included. If a case was reported by death certificate, the certifying physician was questioned; if complete information on the case was acquired, the case was registered. In Connecticut at that time, the registration system rested on voluntary reporting from about 30 of 37 general hospitals and several out-of-state hospitals and agencies (57, 69). Not until 1962 were requests for information on death certificate-reported cases routinely made to the certifying physician as well as to the listed hospital. In 1962, of 500 such requests, the physicians supplied adequate information on 309 cases (22).

After the international symposium, the CTR continued to cooperate with the registries of Norway and Denmark in studies of comparative survival among patients with cancer of the colon or subsites. With Finland, the CTR participated in studies of stomach, esophagus, and breast cancers. The cooperative study of leukemia with Denmark required not only the initial agreement on standard definitions but also involved continuing evolution of diagnostic criteria (8).

Other Changes in Registration

Beginning in 1962, additional tumors were made reportable. These neoplasms had been considered nonmalignant, but the Connecticut State Medical Society now thought the tumors worthy of surveillance or even suspected them of being malignant in behavior. The urinary bladder papillomas had been coded as malignant at the CTR since 1957 and, in 1962, all other urinary system papillomas were so designated, according to the 1951 MOTNAC histology code (---5) (70). The additional reportable tumors were: 1) all neoplasms of the CNS; 2) papillomas of all urinary organs (ureter, urethra, kidney, renal pelvis, and bladder); 3) carcinoids of the entire digestive tract; 4) papillary, mixed papillary, and follicular adenomas of the thyroid; 5) all pituitary gland tumors; and 6) salivary gland mixed tumors. In 1964, benign Kaposi's sarcoma and bronchial adenomas became reportable. Bronchial adenomas and polycythemia vera were coded as malignant until the advent of the SEER code in 1975. From 1960 to 1963, the solitary lymphomas were coded to the lymph node codes (060-069) and to the special lymphatic codes (000-021) when multiple or generalized. In March 1963, all cases were recoded to the 000-021 lymphoma codes (71).

Quality Control

Quality control procedures were directed at the accuracy of the coded tumor record and the subsequent punch cards. The coders could get advice from supervisors and a physician. Attendance at conferences and lectures on cod-

ing provided continuing education for the coding staff. Routinely, a sample of records was recoded and compared with the original coding; also, consistency checks were run on the punch cards. Groups of hospital records were reabstracted by CTR personnel for quality checks of hospital registry abstracting (22).

Publications

Under the influence of the EREP of the NCI, the emphasis was on survival studies. The CTR staff published a whole series of such studies in the 1960s and many papers on incidence trends. The large data base of cases registered over 30 years made it possible for the staff to study the rates of cancer occurrence in relation to many demographic and tumor variables. The Registry staff produced several valuable monographs on cancer incidence, survival, and mortality in Connecticut for the years 1949 through 1964 (text-table 1).

The 1957-67 decade in the history of the CTR was one of cooperation with the ERG and in international studies. Advances were made in the completeness and uniformity of registration; in their extensive efforts in reviewing records, the staff checked the quality of registration. It was also a fertile period in the number of studies published by the CTR staff.

Accelerated Growth in Registration: 1968-72

Many alterations in its requirements for registration were made by the ERG that meant changes in CTR procedures. For example, a new manual was issued in 1967 (72), several important new elements of information about each cancer case were now required, and new fields were added to the punch card: for multiplicity and laterality of the tumor separate from primary site code, date of first treatment, and a new extent of disease code. Primary site coding became more detailed at many sites for compatibility with the new Eighth Revision ICD, although the ERG and the CTR 1968 codes kept the Seventh Revision as their base (72, 73).

Completeness of Registration and Follow-up

More extensive follow-back of cases identified first from death certificates through physicians as well as hospital records had been inaugurated, and greater effort was put into this as the size of the CTR staff increased. As a result, only 2% of 1968-71 registered cases were DCO. The cancer case records of 2 more hospitals that had been abstracted previously by CTR field staff were routinely reported beginning in 1970. At the Veterans Administration hospitals, CTR field workers abstracted case records weekly. Follow-up for vital status now included city directory search (Flannery JT: Personal communication). New case reports continued to be checked manually in an index file for possible previous registration.

The CTR staff continued to abstract samples of hospital records for comparison to the original tumor records. Regular auditing at the hospital level has remained a routine procedure.

Legal Requirement for Hospital Reporting

In 1970, the State Legislature decided to delete the allocation for the hospitals reporting cases. A legal requirement for all types of hospitals licensed under State statute to report cancer cases to the CTR was substituted (2). However, NCI funded the reporting award, and payments were made to cooperating hospitals through 1979. Cancer patients in federal facilities, such as Veterans Administration hospitals, still were not reported, but their records were abstracted by CTR field staff. Whether the loss of subsidization incentive after 1979 will change the quality of reporting remains to be seen. Over the years, hospital registrars have developed and maintained a high quality performance which is promoted by their professional organization. We hope that the CTR will provide some compensatory services to the reporting hospitals when the newly developed computerized data management system is in operation.

Data Management

An increment in funding in 1970–71 allowed the CTR to contract for a systems analysis to determine what was necessary to progress from a punch card-oriented to a magnetic tape system. Under the contract, programs were written to merge the various card types (index, analysis, follow-up) and 750,000 cards were put on tape. With a tape file, input, maintenance, and editing were made easier. This CTR master file could be updated more rapidly with new cases and with follow-up information. The annual follow-up requests to the hospitals were generated regularly from a follow-up file tape. Programs were written for incidence analysis for use with the new tape file, making possible production of tables for a large number of variables. After the NCI supplied the survival analysis program to the CTR, the ERG data, forwarded to the NCI for its survival studies, were now submitted on tape (Flannery JT: Personal communication).

The CTR paper files, consisting of the original hospital tumor abstracts for each of approximately 350,000 cases, plus hospital and pathology records, surgical notes, autopsy summaries, and death certificates, remained basic to the system. These files have been particularly valuable in research for which more detail is required than that of the coded data. In addition to the files of case records, the CTR maintained books of alphabetical indexes and lists by site, hospital, etc., all of which created a mammoth storage problem, even while the number of cases was growing by 10,000 a year (1970–71)! The task of data collection and management has expanded to an awesome proportion.

Surveillance, Epidemiology, and End Results Program: 1973–80

A new relationship between the CTR and the NCI began with the inauguration of the SEER Program in 1973 (74). Although the CTR had been cooperating with the EREP of the NCI since 1956, involvement with the SEER Program has changed and strengthened many aspects of registration at the CTR.

Background of Collaboration With the Program

Reflecting the growing national concern with health care and especially with the leading causes of death, health issues were much touted during the political campaigns of the late 1960s and were acted upon by the President and Congress. The National Cancer Act was signed into law in December 1971 (75, 76).

The NCI, engaged in the assault on cancer since 1937, was made responsible for accomplishing the new thrust of the National Cancer Program. The study and planning for legislative action pointed up the need for national cancer statistics. Part of the charge by the National Cancer Act was to “collect, analyze and disseminate all data useful in the prevention, diagnosis and treatment of cancer” (74). Previously, data on incidence had been gathered in the ad hoc surveys, the first in 1937–39, the second in 1947–48, and the third in 1969–71 (77). Survival data had been provided by the ERG of hospitals and population-based registries, the CTR among them. With the establishment of the National Cancer Program, “an enlarged role for population-based registries as sources of data on both cancer incidence and therapeutic end results was obviously indicated” (78). Information was needed for researchers and clinicians to plan programs and to evaluate their impact in preventing cancer and in reducing cancer mortality (74).

The Division of Cancer Cause and Prevention (now the Division of Cancer Etiology) of the NCI appointed an Advisory Committee on Population-based Epidemiology Research Centers that recommended establishment of a network of registries rather than a national central registry. The Committee thoroughly examined the options and provided a plan for a decentralized but coordinated registry system. The ERG registries already in operation and the areas involved in the Third National Cancer Survey were to be evaluated as possible participants in the national network for these expanded purposes. In 1971, the Committee made recommendations for the objectives, guidelines, selection of registries, funding mechanisms, and the national coordination of the registry system. The primary recommendation was that the NCI should develop a coordinated program of cancer surveillance, descriptive epidemiology, and end results evaluation (78). The program would provide the means of 1) identifying secular trends in specific cancers, 2) identifying variations in disease incidence that may lead to etiologic hypotheses, 3) assessing the efficiency and quality of the medical care system, and 4) doing studies by which primary and secondary preventive measures can be evaluated (78). The population-based registries would provide the incidence data for etiology studies, and the ERG registries could continue to provide the data on which evaluation of treatment and survival experience are based.

The SEER Program registry network was set up in 1973 with NCI contract support under the coordination of the Biometry Branch of the Field Studies and Statistics Program. Eight registries had been selected to participate, including the CTR, and 3 others entered the program afterward (46).

Requirements of Participation in the Program

The CTR, as it had been functioning in the Connecticut State Department of Health, and, as part of the ERG, had already established many of the features desired for a SEER registry. It was already providing a continuous collection of cancer incidence and survival data for a geographically defined area, i.e., the whole State. The State had a stable population of approximately 3 million that was fairly representative of the northeastern United States, having had a long history of ethnic mix resulting from immigration beginning in the late 1600s but especially in the late 19th and early 20th centuries. Manufacturing and industrialization of the urban centers had developed along the rivers in the 1800s, yet many townships in the State had remained predominantly rural.

Good diagnostic services and medical care were available to all areas of the State. The medical center at Yale University maintained specialized oncologic services which provided backup for about 40 community and regional hospitals. The recently founded University of Connecticut Medical Center already had the nucleus of similar services. There had been a 30-year history of cooperation by the medical profession and hospital registries, and, in 1971, cancer reporting by hospitals had become a legal requirement in Connecticut. Cancer registration for a representative population met good standards of completeness and quality.

Changes in Registration Procedures Under the Program

The emphasis of the SEER Program on the statistics of cancer incidence and the concomitant concern for completeness of registration have increased the endeavor in out-of-state case-finding. The CTR has invested greater effort to get information on Connecticut residents who have gone to out-of-state hospitals for diagnosis or treatment of cancer. In the area hospitals of Springfield (Mass.), and Providence and Westerly (R.I.), such cases are abstracted by CTR staff. Reports from the Memorial Sloan-Kettering Hospital in New York City have been sent to the CTR for some time, and the New York State Health Department Registry began sending the cancer case reports of Connecticut residents from their hospitals in late 1979. About 200 cases per year have been registered by the CTR in this manner (Flannery JT: Personal communication). Each SEER registry was obligated to submit annually to the NCI a magnetic tape of the data on every newly diagnosed cancer case. A system of active follow-up on each patient and follow-back procedures for cases reported first by death certificate were required. The details of format criteria, definitions, and coding were spelled out in the 1976 SEER Code Manual, related booklets, and in operational notes (74, 79). To assist the SEER registries to meet the criteria and standards of the program, the staff of the Biometry Branch (NCI) set up training sessions, workshops, and visits.

Therefore, the SEER Program has had a great impact on CTR operations. The number of required elements was increased, and many of the items previously registered were defined in greater detail, especially the extent of disease and treatment fields. Additionally, benign tumors

became reportable in Connecticut: benign cystosarcoma phyllodes of the breast in 1975 and all mesotheliomas and histiocytomas in 1978. Classification and coding of primary site and histology changed in 1975 to a system based on the ninth preliminary revision of the ICD (79) and in 1977 to the 1976 ICD-O which was based on the final revision of the ninth ICD (80). Because the early CTR site codes were not compatible with those of the SEER Program, the CTR staff began to review and recode under current rules to simplify eventual conversion to the new computerized registration system. Approximately 16,000 cases were recoded, which resulted in improvement of the data base quality (81).

The first tape sent by the CTR to SEER consisted of the cases diagnosed in 1973; a tape of all cases diagnosed in that year and afterward has been submitted annually.

Establishment of the Connecticut Cancer Epidemiology Unit

The NCI Advisory Committee had recommended that a population-based registry in the SEER Program have a capability of increased epidemiologic research using the Registry data (78). In Connecticut, exigencies of the ever-increasing size of the registration task and of tightening State budgets had slowly decreased the research use of the data. After meetings in 1971 between key NCI Biometry Branch personnel and the State Health Department commissioners, the latter group decided that a cancer epidemiology research unit could not be situated in its department. Further meetings were held among the NCI deputies, the Connecticut health commissioners, representatives of the State Medical Society, the Connecticut Division of the American Cancer Society, the University of Connecticut Medical School, and the Yale University Medical School. A decision was reached in 1972 that a cancer epidemiology research unit be established at Yale University, funded by NCI, under the aegis of the sponsoring council representing all the institutions. Throughout 1973 and 1974, planning and organization ensued, and by the end of the year, the CCEU was in operation (2, 82). The cooperative efforts, which had been so evident among medical, public health, and lay groups in the original establishment of the CTR, were again manifest in the formation of the CCEU.

In the years following the organization of the CCEU, its staff has analyzed CTR data in descriptive epidemiology, cohort, and case-control studies. The research use of the data has augmented the CTR system of hospital record review and registration checks; many items have been clarified. Above all, the value of the CTR has been repeatedly demonstrated.

New Systems Design

Collaboration has been the mode of the CTR, the Connecticut State Department of Health Services, and the CCEU under NCI support in the SEER Program. The CTR staff has instructed CCEU researchers and assisted them in the use of the Registry data file, its records, codes, and criteria. As studies were performed by CCEU staff, feedback to the CTR added another dimension to quality editing and checking procedures. The experience of CCEU

investigators with the data file was useful to the systems design staff who worked from 1975 to 1982 on converting the computerized data management system [Thetford NA: Personal communication; (81)]. When CTR participation in the SEER Program began, the NCI supported collaborative efforts in the design and implementation of a new, automated data management system at CTR. Both the needs of State registration and follow-up and the requirements for submission of data to the SEER Program had to be met. Early in the designing of the system, the CTR, the CCEU, the California Registry, and the NCI Automatic Data Processing Section worked together on aspects that might be transferable to other registries. Each of the teams from California, Connecticut, and the NCI were responsible for designing different units of the system (83). The procedure resulted in delays, but, in Connecticut, the newly designed core system was running parallel to the previous CTR in the spring of 1983.

The plan is that the redesigned CTR master file will be compatible with the SEER format and include additional coded input for the use of Connecticut physicians and hospitals. The necessary auxiliary programs are being revised for tape input, and for the first time the CTR programs will not be card oriented. An extensive system of edits will be included: Other procedures now performed manually will be automated. Automatic, computer-based name matching will check for possible duplicates of registration, and the death certificate file will also be linked to the system. These procedures will further improve data quality. Linkage programs favor more economical research studies involving occupational and industrial cohorts.

Conclusion

Each decade of registration of cancer in Connecticut has reflected the changes in medical understanding of this disease; the classification and particulars of the information registered were adapted accordingly. In evaluating a registry and its data, it is important that one recognize problems associated with contemporary variations that affect completeness and quality of registration. These include purpose of the originating group, reporting sources, information available in the records, diagnostic methods, screening programs, medical management of patients, autopsy practices, availability of medical facilities, and attitudes of patients toward cancer and seeking treatment (83).

The custodians of the Registry have remained faithful to the charges originally given by its farsighted founders. Despite a burgeoning population with growing demands for medical care and hospitalization, physicians and hospital registries have persevered in providing the necessary cancer data to the CTR. The detail of the data has expanded, but modern computer techniques are being applied to the ever-compounding task of registration. The possibilities arising from computer methodology for the examination, analysis, and linkage of data, such as environmental and occupation sets, introduce exciting options. The potential of a population-based cancer registry of high quality presents remarkable challenges for epidemiology and other medical research. By continuing to coop-

erate in national and international cancer registry programs, the CTR multiplies the capacity for resolution of the cancer problem. This Registry has risen to the challenge of change and has moved with sharpened definitions of quality, building on the plans and the solid foundations laid 5 decades ago.

CLASSIFICATION AND CODING SCHEMES FOR THE PRIMARY SITE AND HISTOLOGY OF NEOPLASMS USED BY THE CONNECTICUT TUMOR REGISTRY

Problems of Changes in Classification Schemes

Comparability in the classification of primary site is of significant consequence when one considers trends in cancer. Several systems of classification and coding for the primary site and histology of tumors have been used by the CTR during the decades of cancer registration. The scope of the coding has increased over the years, reflecting the growth in knowledge of biologic structure and behavior of tumors and a greater understanding of the disease process. A demand for more detailed information has expanded the number of terms used.

Because "uniform definitions and uniform systems of classification are prerequisites in the advance of knowledge," nosology has been an important concern of the medical statistician for more than 2 centuries (84). The differences in purpose of a medical nomenclature versus a statistical classification must be recognized when one considers the choices among schemes (84). The adoption of each classification or a change by the CTR reflected the mutations in the systematic studies of classification and in the general acceptance of a particular system in any period. The classifications of primary site have been based chiefly on anatomic site of tumor origin.

The 6 changes in primary site classification and in coding schemes during the 4 decades (text-table 3) were made so that the detail available on site location could be increased and made compatible with classifications used in other organizations and in the coding of cause of death on death certificates (27). Although recent codes may be more detailed, they may not be completely comparable to earlier codes in the content of a particular rubric or a combination of rubrics. When the change from one code to another was only in the code number and the content had been maintained, matching was not a problem. Problems arose when components of old rubrics were different or incomplete when compared with the new rubrics. For statistical analysis of time series, or for comparison of data from one period with another or from different data sources, the primary site title must remain identical in content.

The general problem of classification and the particular difficulties in matching the ICD-7 and ICD-8 have been delineated previously (92, 93). A comparison of the actual code numbers and titles has also been made (94). When the Connecticut codes, which are based on the several ICD editions, are compared, similar difficulties arise and parallel the problems that occur when ICD-7 or ICD-8 are compared with ICD-9.

TEXT-TABLE 3.—*The CTR coding protocols used for primary site, histologic type, grade, and stage of malignancy of neoplasms*

Date	Anatomic site (topography)	Histology (morphology)	Grade	Stage
1935-48	Nomenclature of Diseases, Memorial Hospital for Cancer and Allied Diseases, New York City (49, 50); AMA Standard Nomenclature (86) converted to 1949 CTR code based on ICD-6 (87) then to 1960 CTR code	Dr. Shields Warren's code, Massachusetts General Hospital (50) Connecticut Medical Society Pathologist's code; converted to 1951 MOTNAC (70)	Connecticut Medical Society Pathologist's Grade System assigned by the pathologist	American Cancer Society Cancer Prognosis Manual (85) (CTR stage)
1949-56	1949 CTR code, based on ICD-6; converted to 1960 CTR code	1951 MOTNAC	"	"
1957-67	1960 CTR code, based on ICD-7 (61)	" "	1951 MOTNAC but grade II = 9	1966, simplified form of CTR stage
1968-72	1968 CTR code, based on ICD-7 with additional ICDA-8 titles (88)	" "	1951 MOTNAC histology, 3d digit	"
January 1-August 1973	"	" "	1951 MOTNAC but grade II = 9	"
September-December 1973	"	1951 MOTNAC AND 1968 MOTNAC	"	"
1974	"	1968 MOTNAC (89)	1968 MOTNAC	"
1975, 1976	1975 SEER code (79) based on preliminary ICD-9 (90)	1975 SEER code	1975 SEER code	CTR stage and 1975 SEER code
1977-80	1976 SEER code (79, 91) based on ICD-O	ICD-O (80)	ICD-O	CTR stage and 1976 SEER code

List of Titles Found Comparable in the Connecticut Tumor Registry

The titles for the major primary sites and subsites determined to be comparable from the earliest CTR coding system to the present ICD-O classification are listed in text-table 4. If a later coding scheme separated the content of a title into 2 or more codes, the 2 or more titles were combined to correspond to earlier codes. By contrast, tumors previously coded to an earlier combination title could not always be converted to the more detailed subsite code, even with review of the hospital records (if the records were still available). Such cases were then assigned to the NOS category within the primary site code.

When a primary site code change was made at the CTR, many old records were reviewed so that the site codes could be changed to the more specific designations. Fortunately, the CTR staff often had used more specific codes than the earlier edition of the ICD.

To prevent the loss of some specificity in conversion to a new code, the Registry staff frequently continued to use the previous title and code. The CTR is now using the ICD-O classification (80) of neoplasms based on the most recent WHO revision of ICD-9 (90); we use ICD-O titles in our tables. The ICD-O title and code indicate the particulars of each title, but synonyms can be found in the ICD-O Manual. The ICD-O order of classification has

been kept. No tables have been included for "hematopoietic and reticuloendothelial system" and "lymph nodes," for which the neoplasms are of special histologic types. These special histologies, i.e., ICD-O M-959-997, the lymphomas, Hodgkin's disease, reticulosarcomas, multiple myeloma, mycosis fungoides, and the leukemias, are classified by histologic code and tabulated separately, after the anatomic primary sites. Thus cases of these histologic types have been excluded from every anatomic site; an indication of their frequency at the site is available in summary table 1. The miscellaneous reticuloendothelial tumors (77 cases), which are excluded from the other anatomic sites, are tabulated with "other, ill-defined, and unknown primary sites."

First Registration Period: 1935-48

A primary site code which was based on the second edition of the National Conference on Nomenclature (later published by the American Medical Association), *Standard Nomenclature of Diseases* (86), was used by the CTR in this first registration period (95). It was a 3-digit code for the anatomic sites of the body. The code from the *Nomenclature of Diagnoses of the Memorial Hospital for the Treatment of Cancer and Allied Disease, New York City* (50, 96, 97), which had many more detailed rubrics, was punched into the tumor registration cards as well. The

TEXT-TABLE 4.—*Classification of malignant neoplasms by primary site or type of tumor, comparable in the CTR, 1935–82, ICD-O titles and codes^a*

Primary site of malignant neoplasm	ICD-O code
All sites, except nonmelanomatous skin	140–172; 173:M-872–879; 174–199
Lip	140
Upper lip NOS: mucosa of upper lip	140.0, 140.3
Lower lip NOS: mucosa of lower lip	140.1, 140.4
Other specified parts of lip; lip NOS	140.5–140.9
Tongue	141
Base of tongue NOS; lingual tonsil	141.0, 141.6
Other specified tongue; tongue NOS	141.1–141.5, 141.8, 141.9
Major salivary glands	142
Parotid gland	142.0
Other specified salivary glands and NOS	142.1–142.9
Gum, floor of mouth, other unspecified parts of mouth	143–145
Lower gum, floor of mouth	143.1, 144.0–144.9
Other gum and mouth	143.0, 143.8, 143.9, 145.0–145.9
Oropharynx	146
Tonsil NOS; tonsillar fossa	146.0, 146.1
Tonsillar pillar; vallecula epiglottica	146.2, 146.3
Other oropharynx	146.4–146.9
Nasopharynx	147
Hypopharynx	148
Pharynx NOS, and Waldeyer's ring	149.0, 149.1
Ill-defined sites in lip, oral cavity, and pharynx	149.8, 149.9
Esophagus	150
Upper third	150.0, 150.3
Middle third	150.1, 150.4
Lower third	150.2, 150.5
Esophagus, junctions, and NOS	150.8, 150.9
Stomach	151
Small intestine	152
Duodenum	152.0
Jejunum and ileum	152.1, 152.2
Other small intestine	152.3–152.9
Colon	153
Transverse colon, hepatic and splenic flexures of colon	153.0, 153.1, 153.7
Descending colon	153.2
Sigmoid colon	153.3
Ascending colon, cecum, and appendix	153.4–153.6
Colon NOS, and combined sites	153.8, 153.9
Rectum, rectosigmoid junction, anal canal, and anus	154
Rectum, rectosigmoid, and rectum	154.0, 154.1, 154.8
Anal canal and anus NOS	154.2, 154.3
Liver and intrahepatic bile duct	155
Gallbladder and extrahepatic bile duct (includes biliary tract NOS)	156
Pancreas	157
Head of pancreas	157.0
Body and tail of pancreas	157.1, 157.2
Other pancreas and NOS	157.3–157.9
Retroperitoneum and peritoneum	158
Other and ill-defined sites within digestive organs and peritoneum	159
Intestinal tract, NOS	159.0
Ill-defined sites and gastrointestinal tract NOS	159.8, 159.9

latter code had the advantage of being fine enough to match any contemporary nomenclature by combinations of its detailed titles. It was gradually found more useful than the *Standard Nomenclature of Diseases* and many of the refinements of the Memorial Hospital code were incorporated into the later *International Lists of Diseases and Causes of Death* [(87); Macdonald EJ: Personal communication].

During this period, the histology of the tumor was coded in the Connecticut Pathologist's 3-digit code, with a possible fourth digit (98–100). In addition to the Pathologist's code, the histologic coding developed by Dr. Shields Warren in Boston for the Massachusetts Diagnostic Cancer Clinics was used in the earliest period of the CTR. This code was a 2-line code but not too detailed [(50); Macdonald EJ: Personal communication].

New Primary Site and Histology Codes at the Connecticut Tumor Registry: 1949–56

A reorganization of the Registry in 1950 included a change in the classification scheme for primary site and histology that was compatible with the more complete and internationally accepted system, the Sixth Revision of *The International Lists of Diseases and Causes of Death* (27, 87). The ICD-6 revision was the first in which the classifications of sickness and causes of death were combined. It was produced as a result of the work of an expert committee and accepted at an international conference in 1948. The First World Health Assembly incorporated *The International Statistical Classification of Diseases, Injuries and Causes of Death*, as it was titled by the Expert Committee, into its "Manual" (ICD-6) (87). The United States began to use it for coding causes of death in 1949 (101). The adoption of this classification at the CTR prepared the way for national and international collaboration.

At the CTR, the ICD-6 coding scheme of 4 digits was modified to a 3-digit code. Separate codes for benign and malignant neoplasms were not needed because another CTR code field recorded the degree of malignancy, and secondary (metastatic) cancers were not registered separately. The ICD-6 system of coding lymphatic and hematopoietic neoplasms only by histology was modified to an anatomical primary site classification because the CTR coded histology in a field separate from site. However, the comparability to the ICD-6 rubric was maintained even when CTR had more subdivisions of the rubric.

The histologic classification and 3-digit coding which the CTR used during this period was that of the preliminary draft of the *Manual of Tumor Nomenclature and Coding* which was distributed in 1950 and later published by the American Cancer Society (70). This Manual had been developed by a working team from the NCI, American Cancer Society, American Medical Association, the American Society of Clinical Pathologists, the Armed Forces Institute of Pathology, National Research Council, the United States Public Health Service, and the United States National Committee on Health and Vital Statistics (27). It was designed to be used with the International Statistical Classification. In the histology coding of this era, one must note that carcinomas at a glandular site were

coded as "adenocarcinoma." Grade of malignancy was based on the pathologist's specification (95).

In the reorganization of the CTR, these primary site and histology codes and accompanying coding rules were put into effect. All 1935–49 records were manually recoded to the new systems (27). In the change, many cases had to be assigned to the NOS subsite within a primary site because the site information was not as detailed in those earlier cases. The tumor record of earlier years had not required as much detail from the hospital, and the practice of requesting copies of the actual hospital charts did not begin until the late 1960s.

International Classification of Diseases, Seventh Revision, the End Results Group, and the Connecticut Tumor Registry Codes: 1957–67

When the CTR became affiliated with the EREP of the NCI, the CTR codes had to be adapted so they would be compatible with the ERG system or the UPC code (102). The CTR staff began using the first version of the 1960 CTR primary site coding system (8), and this new site code was used for cases diagnosed in 1957 or later. Some additional subsites and codes were added in the early 1960s. For primary site, the CTR and the UPC classifications were essentially based on the ICD-7 section on neoplasms (61), except that the CTR again did not use the separate site codes for neoplasms of benign and unspecified nature or those for secondary neoplasms and omitted the first digit (1). Some of the sites in the 1960 CTR code had more detailed subsite codes than the ICD-7 scheme, as did the UPC code (for esophagus, stomach, pancreas, peritoneum, larynx, breast, eye), and the rubric content for the subcategories of the lymphomas and leukemias differed (35). This new code added a special digit (.8) for combination sites within the 2-digit site code for most primary sites as well. By 1961, all parts of the coding system were operational (8, 63). The punch cards were converted by a commercial group. All records in earlier codes were recoded. However, one must be aware that during the changeover period from 1957 to 1960, some specificity in the recording of primary site and histology was lost. Hospitals had been requested to submit brief records and follow-up was minimal, so that cases registered at this time may not have had some of the detail actually available in the hospital. In addition, cases recoded to the new code may have lost some specificity of subsite coding, and higher proportions of 1935–61 cases at any major site would go into the NOS subsite category. For the major sites themselves, at the 2-digit code level, matching did not present a problem.

The 1951 MOTNAC (and its nearly identical "corrected edition," 1953 MOTNAC) system continued to be used during this period for histology coding. The grading system of the 1951 MOTNAC was used, rather than the Connecticut Pathologist's system, although Connecticut did not use the code .9 for "malignant neoplasm metastatic site" but rather for grade II "partially differentiated or moderately undifferentiated." The grade designated by the pathologist was coded according to the 1951 MOTNAC (71).

Effects of The International Classification of Diseases, Eighth Revision, End Results Group 1976 Code, and the 1968 Connecticut Tumor Registry Codes: 1968-72

When the ERG issued a new manual in 1967 (72), the primary site classification and codes were adopted in almost identical form in the 1968 CTR codes (73). The 1967 ERG and 1968 CTR codes were based on the neoplasm section of the 1955 ICD-7 as the 1960 CTR code had been. The principles and order of the classification remained the same, but more codes for anatomical sub-sites were added to provide the detail and the expansion which occurred in the 1965 ICD-8 (88, 103). The numbering and ordering of the system were not changed to match the ICD-8, but the added subdivisions and code numbers made it possible for one to match the ICD-8 rubrics, if necessary (72).

The ERG code added new codes for paired organ sites and for multiple lesions at certain sites. For histology, the 1951 MOTNAC continued to be used at the CTR. During this period, the grade was coded as that of the 1951 MOTNAC histology third digit, without regard to designation on the pathologist's report.

1968 Manual of Tumor Nomenclature and Coding and the 1968 Connecticut Tumor Registry Codes: 1973-74

Use of a new histology code and protocol were introduced at the CTR in September 1973 (89); this was a 4-digit code for histology based on the morphology section of the malignant neoplasms in the *Systematized Nomenclature of Pathology* (104) but with 250 additional terms, mostly synonyms. The fourth digit of the code designates the degree of malignancy (behavior) of the neoplasm and the grade.

During this period, the CTR staff maintained their use of the 1968 CTR code for primary site of neoplasms rather than the 1968 MOTNAC scheme. The 1951 MOTNAC coding for the histology of the tumor was entered for a short period (September through December 1973) in addition to the 1968 MOTNAC coding. Beginning in 1974, only the 1968 MOTNAC histology code was used. Comparability and conversion problems for the primary site field were clarified by the inclusion of a few additional code numbers. Much of the code conversion for histology could be done mechanically from a system elaborated and tested by the ERG. The CTR master tape included a code flag that indicated whether the conversion was mechanical or manual. When problems occurred in the conversion, considerable record review and manual recoding were done.

International Classification of Disease, Ninth Revision, and the 1975 Code Manual of the Surveillance, Epidemiology, and End Results Program: 1975-76

Another era began in January 1975 when new coding and recoding were done according to the 1975 SEER code (79). International working parties and consultants had been revising the content and structure of the ICD-9 chapter on neoplasms (80) since the request made by the WHO to the IARC in 1968 (105). A preliminary format was

developed and the *Field Trial Edition* of the ICD-O was circulated for trials. The authors of the 1975 *SEER Coding Manual for Primary Site and Histologic Type* used the ICD-O topography section for site. The morphology coding remained the same as the 1968 MOTNAC. At the CTR, the primary site code was the SEER 3-digit code; the first digit and decimal of the ICD-O code were omitted. The histology code continued the 4-digit 1968 MOTNAC code in which the fourth digit designated both the degree of malignancy and the differentiation of the tumor.

International Classification of Diseases for Oncology, 1976: 1977-80

On January 2, 1977, the CTR began to use the ICD-O code (80) for both primary site and histology. The ICD-O added terms and codes for histology to chapter 2 of ICD-9. These extra terms include those presented, after considerable international effort, in the WHO series *International Histological Classification of Tumors* (106). The introduction to the ICD-O Manual points out that it is a coded nomenclature for topographic sites and histologic types of neoplasms to provide greater detail in coding, but it is not a tumor classification scheme because the terms of several classifications (80, 93) are included.

The CTR uses the last 3 digits of the ICD-O topographic site code for most sites but omits the first digit (1) and the decimal. The ICD-O code, in contrast to the ICD-9, has neither separate site codes for benign and malignant neoplasms nor for the lymphatic and hematopoietic tissue neoplasms. Separate ICD-O morphology and behavior codes take care of that information. However, the CTR continues to use distinctive site codes for multiple myeloma, melanoma of the skin, mycosis fungoides, and the leukemias to facilitate histology and site editing. The method of matching or converting the 1968 MOTNAC code to the ICD-O morphology code is explained in the "Introduction" to the ICD-O as are the definitions and the rules. The histology code is 6 digits long, 4 for histology, a fifth for behavior, and a sixth for differentiation.

Because the special problems of conversion to a new morphology code are recognized, the CTR continues to include on its master tumor file tape the original coding as well as the ICD-O histology code, if the record was converted mechanically. When the record was manually checked and recoded, the original coding was not kept. A 1-column code allows the researcher to determine whether the histology coding of a record was converted mechanically or manually.

At the time of inauguration of the use of the 1975 SEER and the ICD-O codes at the CTR, the staff was actively attempting to recode primary site and morphology. This has involved a careful manual review of many hundreds of registration records and a large part of the CTR historical file (1935-56) for more accurate conversion to the new code.

Those major and detailed primary site titles that can be identified discretely in the CTR for the 45-year period and the 6 code changes are listed in text-table 4. For those users who wish to define more explicitly the content of the

various codes and rubrics, the list presents the ICD-O primary site titles (plus histology for the special neoplastic types, such as the leukemias) and the codes. Complete sets of titles are not written out for each code but, by referring to the published ICD-O, one can check the titles, their synonyms, and inclusions.

Subsequent to the work done at CCEU to match site code content among the various ICD and MOTNAC editions, staff members of the Biometry Branch, NCI, have produced several useful conversion manuals (107-109).

TABLE PRESENTATION

The Data Set

The incidence of cases of primary malignant neoplasms registered in the CTR that occurred among Connecticut residents from 1935 through 1979 are presented in the tables in this volume. Cases of in situ neoplasms are excluded from these tables (3.7% of all cases). Their frequency is tabulated in additional tables. The data for cases designated as benign or of uncertain malignancy for brain, CNS, and polycythemia vera are presented because these data have often been combined with those for malignant cases. The data for all 316,000 primary malignant neoplasms diagnosed during 1935-79 form the main body of the tabulations. Other tables are given for 12,089 in situ cases (98.7% of all in situ cases) and 7,496 cases of benign or uncertain malignancy. The CTR data published previous to 1973 included in situ tumors with the malignant.

Incidence Frequency and Rate Tables

The data are presented in tables of frequency of cases and in tables of rates. For the major primary sites, several important subsites, and the principal systemic neoplasms classified by histology, frequency tables are given by sex and 5-year age groups in quinquennia. Morbidity rates are presented for the same sex, age, and year groups. For flexibility in the use of the data, annual frequencies are given as well; the median age is included with the frequencies. The tables of rates by cancer site give the average annual age-specific rates per 100,000 population for the quinquennia, the crude rates for all ages, and the rates age-adjusted by the direct method (110) to the 1950 and 1970 Standard Continental United States Populations, and the World Standard. The cumulative rates for ages 0 through 74 years are given per 100 population (111).

The initial summary tables aggregate the incidence data from the individual primary site tables: frequency distribution, crude rates, age-adjusted rates, cumulative rates, and the percentage of cases histologically confirmed, cases registered first at autopsy, and cases registered by DCO.

Selection of Cases

Cases reported by Connecticut hospitals and physicians are either of living patients or are diagnosed at autopsy; others are registered from death certificates which mention cancer as a cause of death. In addition, reports on Connecticut residents are received and registered from major hospitals and medical centers in neighboring states. Out-

of-state residents diagnosed or treated in Connecticut hospitals are excluded from our data. Cases of tumors diagnosed prior to 1935, which may have been registered for completion of patients' tumor records, are excluded also; those diagnosed after 1979 are not included in these tables.

Cases selected were specified as "newly diagnosed" and as "primary malignant neoplasms" (excluding in situ tumors). The "date of diagnosis" was the basis for the time designation of the incidence of the neoplasm.

The definition of a neoplasm as malignant and primary is a medical one, made by the reporting physician, pathologist, or hospital personnel. In the selection of primary malignant cases from all registered cases for our tables, both the histologic behavior of the neoplasm and the stage of disease codes were used as selection criteria. The designation of the ICD-O morphology fifth digit "behavior" codes (2 and 3), for "in situ" malignancy and "malignant," served to exclude reportable benign tumors, neoplasms of borderline malignancy, metastatic neoplasms, and malignant neoplasms considered "uncertain" as to whether they were primary or metastatic. The in situ tumors were excluded by use of the CTR code for stage of disease. This stage code, adapted from the American Cancer Society *Cancer Prognosis Manual* (85) has been used for 45 years and has always been carefully checked at the time of registration with all diagnostic verification facts, such as physical examination, operative results, laboratory, x ray, and microscopic studies at the time of diagnosis.

The definition of an in situ tumor in the Connecticut coding is "a tumor that fulfills all microscopic criteria for malignancy except invasion." Therefore, this designation must be made by the pathologist in histologic confirmation. A case termed "in situ" but not documented by histologic evidence is coded as "localized." Few cases actually are staged as localized in this manner. Cases registered from DCO information are coded as "unknown stage," except for the leukemias in which DCO cases are staged as "remote," as are tumors of the lymph nodes and malignant myeloma (95). The stages of the malignant neoplasms included in the incidence tables are: localized; regional; remote; not localized, NOS; and unstaged or unknown stage.

The Distinction Between Cases and Persons

The titles of the frequency tables refer to number of cases rather than to persons. The incidence of primary malignant neoplasms is tabulated, not the number of persons with tumors. One person may have 2 or more primary cancers concomitantly or at different times in his life. The 1935-79 data set of 316,000 cases represents 297,128 persons (1.06 malignant neoplasms per person). This means that 18,872 cases are not the first primary occurring in the patient. Each of 279,742 persons (94.1%) had 1 primary cancer, but 16,070 people had 2 primaries and 1,316 had 3 or more (2.1 primaries in 17,386 people). In an earlier analysis of the occurrence of multiple primary neoplasms in 121,460 Connecticut patients, 1935-64, it was found that 5,022 additional malignant tumors were diagnosed as a new primary (nonsimultaneous) after the index primary (4.13%). Nonmelanotic skin cancers were

excluded. Among these 121,460 patients, 1,264 had another primary malignant tumor diagnosed at the same time as the malignant neoplasm designated as the first primary, or 1.04% more (4).

Rules have been established in the CTR concerning the registration of simultaneous diagnoses, independent primaries, sequence of tumors, and involvement of paired organs. The fundamental rule is that the physician's determination is decisive regarding whether simultaneous tumors are independent or metastatic. Neoplasms which occur simultaneously or within 1 month of each other (beginning in July 1979, 2 mo) are considered independent primaries if they present different histologies. The tumors are considered independent when they occur in different organs even if they have the same histologies. When both paired organs are involved with tumors of the same histologic type, a pathologist must make the decision whether the tumors are independent. An exception is made for simultaneous tumors of the ovaries, which are considered to be a single primary.

Number of tumors and sequence have been coded uniformly since the start of registration. Generally with simultaneous tumors, the more widespread neoplasm (by stage of disease information) is assigned precedence, or secondly, the tumor of greatest malignancy (by behavior digit of histology code) or worse prognosis. If the record is unclear and further medical definition cannot be obtained, the sequence is assigned by consideration of site, histologies, date of diagnosis, and extent of disease. When the information comes from the death certificate alone without statement as to interval or sequence, the underlying cause takes precedence, with immediate cause and other significant condition following in that order (95).

The CTR staff began the coding of paired organ involvement in 1962, especially to avoid judgment on the second tumor as a metastasis versus a new primary. From 1962 through 1967, special codes for the primary site had indicated paired organ involvement for breast, eye, lung, ovary, testis, and kidney (71). Since 1968, over 20 organs have been considered paired, but not right and left colon, bone, connective tissue, or skin. However, in 1979, certain bone, connective tissue, skin sites, and additional categories were added to the coding of tumors in paired organs.

Date of Diagnosis

The term "newly diagnosed," used in the headings of the frequency and percentage tables, indicates that the date of diagnosis is considered the *incidence date*. The exact date of the inception of a neoplasm (the beginning of abnormal growth) is unknown. Therefore, the first documented and recorded date from the following events defines the date of diagnosis: the date of first diagnosis by a physician, the date of hospital admission, the date of the pathology report, or the date of death. The date of first clinical diagnosis is the date noted by a medical practitioner even if the diagnosis was confirmed much later by histology or other means. When the exact date of clinical diagnosis is not recorded, the following rules apply: For patients diagnosed in the hospital, the date of hospital admission is

coded as the date of diagnosis; for those diagnosed before hospitalization, the hospital admission date is coded if it is within a month of the approximate date of diagnosis by the referring physician. In regard to cervical cancer, the date of the positive Papanicolaou's test before hospital admission is the coded date of diagnosis. When the fact of cancer is registered as DCO or diagnosed at autopsy, the date of death is entered as the date of diagnosis. This practice increases the incidence rates for older age groups. In the uncommon case when a physician determines that a tumor, which had previously been judged to be benign, was actually malignant, the date of diagnosis is coded from the date of the earliest evidence, the date of surgery, or the pathology reports of the original occurrence (95). For most cases in the CTR, the date of diagnosis is the date of hospital admission.

For all of the tables categorized by individual primary sites, except the annual frequency table, data are presented by 5-year periods of diagnosis.

The actual time from first neoplastic growth or malignant development to the clinical diagnosis may be lengthy. The problems this creates in the exclusion of prevalent from new cases is discussed elsewhere (112). The great care the CTR staff had taken to check for and to exclude previously diagnosed cases and the uniformity of definition over 45 years of registration has served to maintain comparability within the Registry. We must recognize that changes have occurred in diagnostic techniques, surgical practice, frequency of surgery, climate of medical practice, extension of screening examinations, patients' demand for medical care, and in the proportion of autopsies performed. All these factors have influenced the time and frequency of cancer diagnosis. Connecticut has benefitted from widely available, good quality state-of-the-art medical and hospital care for all the years the Registry has operated. The medical, social, and attitudinal changes that may have influenced the diagnosis of cancer have created some problems for those who conduct epidemiology studies. More importantly, these changes mean improved diagnosis and patient care and should lead to greater cancer control and better survival.

Age at Diagnosis

The patient's age at the date of diagnosis for each cancer has been registered since 1935 as the age at the last birthday. When the actual birthdate was available on the hospital chart or tumor record, the accuracy of the given age was checked. When the case was diagnosed at autopsy or as DCO, age at death was recorded for the age at diagnosis.

For all table formats, 5-year groupings of age at diagnosis are used up to age 85 years; ages 85 and over are combined. Unknown age cases are tabulated in the frequency and percentage tables but are not included in the rate tables (of 316,000 cases, the age of 256 was unknown, i.e., less than 0.1%).

Median Age

The median age at diagnosis is given on the annual and 5-year frequency tables for the individual primary sites

and on the summary tables by age groups. The median age is defined and calculated as the age which divides the population into 2 equal-sized groups, one of which is younger and the other older than the median (113).

Race

We have not presented any tabulations by race because these data were not uniformly available. Coding of race began in 1960 for patients diagnosed after 1956 and for others diagnosed before that date but whose records were reviewed for any reason such as death. (Information on color was recorded until 1949 and then was dropped.) On the records of most patients who died before 1956, race has been recoded when it was available on the death certificate. The records of over 1,700 patients, diagnosed 1935–56, are coded for race “other than white” or “unknown race,” mostly “black.” The race information on the death certificate is considered to be more accurate than that on the hospital report. During the 1960s when sensitivity on racial issues was high, a few hospitals did not submit this information. Completion of the tumor record necessitates special field staff visits and record searches which are under way. However, for the whole time series, data for race must be regarded as incomplete.

Connecticut had a predominantly white population with less than 5% of the residents either black or of other races until the 1960s. In 1970, the census recorded 6.4% of the State population as “Negro and other races,” and in 1980, the census statistics showed 9.9% nonwhite, 7.0% black (114, 115).

Sex

Separate tables are presented for male and female cases. Seven cases of unknown sex have been omitted from the data set. Data for both sexes combined are tabulated only in the summary tables 1–13.

Primary Site and Type of Neoplasm

Tables are presented for primary anatomic sites or by special histologic tumor type. The titles and code numbers for primary site or tumor type are those given in the ICD-O and are used in each table (80). Primary site or tumor type is identified in each table by the complete ICD-O title and the code number. This detailed classification is used and will continue to be used during the 1980s at the CTR, at other SEER registries, and in mortality coding. The titles for primary sites and the subsites included in each primary site rubric may be checked for equivalence in the ICD-O. Many of the detailed (subsite) titles in the ICD-O scheme are combined in the rubrics used for the tables because the classifications used by the CTR in the early years had less detail and fewer, more inclusive titles. The user may check the content of the titles and may combine sites, age groups, or periods as he or she chooses. To make this possible, we tabulated incidence for several sites where cancers occur infrequently.

The complete ICD-O titles and codes for the primary site groupings for which 45-year incidence tables are pre-

sented are given in appendix table IV. Tables of data, not included in this report, could be obtained for those subsites with classification remaining comparable over the 45-year period of the CTR (text-table 4). Malignant neoplasms of the skin, except melanoma of the skin, are excluded because of the known incomplete reporting for this site. The large proportion of patients with skin cancer has been diagnosed and treated in physicians' offices, but only those treated in hospitals have been adequately reported to the Registry.

For the 2 brain and CNS site groupings, we also present tables for neoplasms with benign behavior or unspecified malignancy (ICD-O morphology behavior codes 0 and 1). One may add these data to those for malignant neoplasms to facilitate comparisons with combined data presented in many publications.

Special Histologic Types of Neoplasm: ICD-O M-9590–9970

Cases of malignant neoplasms of special histologic types are not included in the tabulations for each anatomic primary site. These are aggregated from all sites and are presented under separate titles because of their known unique neoplastic behavior. Most malignant neoplasms of the hematopoietic system, RES (ICD-O 169), and the lymph nodes (ICD-O 196) represent special histologic types; no individual tables for these sites have been included. Included in the table of all sites of malignant neoplasm but not in an anatomic site table are 10 cases, not of special histologic type, which were coded to sites 169 and 196. The extranodal lymphomas and 139 cases of mycosis fungoides are included in the lymphoma tables.

Seventy-seven cases coded M-9710–9722, miscellaneous reticuloendothelioses, and 3 cases of myeloproliferative diseases, M-9950–9970, are tabulated with neoplasms of other ill-defined and unknown sites, i.e., 0.6% of this category for all years. The numbers of cases of special histologic types excluded from each anatomic site grouping are given in summary table 1. Lymphomas, multiple myeloma, and leukemias are tabulated in 4 main categories and 13 individual histologic groupings. Tables for all acute, chronic, and other leukemias are presented because of the many requests for the data in this format. The latter tables duplicate the data of the other leukemia tables.

Polycythemia vera, which has been part of the leukemia category in previous CTR monographs, is presented here as a separate title but is not included in the malignant neoplasm data. In the ICD-O classification, polycythemia vera was assigned a nonmalignant behavioral code, but it continues to be a reportable tumor in Connecticut.

A comparison of the numbers of cases in these tables with previously published data will reveal differences. The changes result chiefly from exclusion of cases of special histologic types and in situ tumors from primary site tables but also from the continuing corrections to the data file with follow-up and death information. During the recent conversion of the data management system, extensive review of the file and recoding to present Registry rules has greatly improved the quality of the data base (81).

Calculation of Rates

In the calculation of the incidence rates, the numerators used are the number of cases registered as occurring in the Connecticut resident population for the specified period, age group, and sex for that primary site, and the denominators are annual midyear estimates of the Connecticut resident population for the same age and sex group (*see* appendix table II). Cases for which the age is unknown are not included in rate calculations.

The crude average annual rate per 100,000 population by sex for the specified quinquennium appears in the rate table. The total number of cases of all ages for the designated 5-year period and sex is divided by the number in the exposed population. This population is the sum of the 5 midyear estimates for the years and sex indicated (*see* appendix table II). The equation is multiplied by the unit of population per 100,000.

For example:

$$\begin{aligned} \text{Average annual} & \quad \text{No. of male patients} \\ \text{crude incidence rate} & = \frac{\text{with lung cancer} \\ \text{for lung cancer in} & \quad \text{diagnosed in 1960-64} \\ \text{males/100,000} & \quad \text{Sum of males} \\ & \quad \text{resident in} \\ & \quad \text{Connecticut exposed} \\ & \quad \text{each year, 1960-64} \\ & = \frac{3,253}{6,496,605} \times 100,000, \\ & = 50.07. \end{aligned}$$

The average annual age-specific incidence rates per 100,000 population are tabulated for each 5-year period of diagnosis by the 5-year age group. The total number of cases of that age for the designated time and sex is divided by the sum of the 5 midyear population estimates for that age, time, and sex. The expressed unit of population multiplies the result. For example, the age-specific rate per 100,000 for lung cancer diagnosed in males aged 50-54 years, 1960-64, is calculated as follows:

$$\begin{aligned} \text{Average annual} & \quad \text{No. of male patients} \\ \text{age-specific} & \quad \text{with lung cancer} \\ \text{incidence rate of} & = \frac{\text{age 50-54, 1960-64}}{\text{Sum of males,}} \times 100,000, \\ \text{lung cancer/100,000,} & \quad \text{age 50-54, resident} \\ \text{males, age 50-54,} & \quad \text{in Connecticut exposed} \\ \text{1960-64} & \quad \text{each year, 1960-64} \\ & = \frac{278}{365,470} \times 100,000, \\ & = 76.06. \end{aligned}$$

To allow comparison of rates in populations differing in age distribution, we presented age-adjusted (or age-standardized) rates. These rates have been adjusted by the direct method (110) to 3 standard populations (*see* appendix table I). The rates for each sex and for each quinquennium which have been age-adjusted to the same standard can be compared directly. The age-adjusted rates appear in the incidence rate tables and in summary tables 8-10. Each age-specific rate per 100,000 is weighted by the proportion of the standard population which is in that age

group. The sum of the weighted rates for all the age groups yields the age-adjusted rate for that sex and time. The Standard Population is that of the continental United States in 1950 converted to a million (*see* appendix table I).

$$\begin{aligned} \text{Average annual} & \quad \text{(age-specific rate, males,} \\ \text{age-adjusted incidence} & \quad \text{1960-64)}^a \\ \text{rate/100,000:} & = \frac{18}{\sum_{a=1}} \times \frac{\text{(Standard Population)}^a}{\text{Total Standard}} \\ \text{lung cancer} & \quad \text{Population} \\ \text{males, 1960-64} & \end{aligned}$$

^a Eighteen age groups are represented (0-4, 5-9, . . . 85+ yr).

Cases of unknown age have not been included.

For example, the age-specific rate per 100,000 for lung cancer in males aged 50-54 for the 1960-64 period is 76.0664. This rate is weighted by the proportion of the 1950 Standard Million Population for ages 50-54:

$$(76.0664) \frac{54,893}{1,000,000} = 4.176.$$

This weighted rate is added to the 17 weighted rates for the other 17 age groups, which results in an age-adjusted rate in 1960-64 for males with lung cancer.

The cumulative incidence rate is the sum of the age-specific rates of the ages 0 through 74 years expressed as percent. For the 15 age groups (0-4, 5-9, . . . 70-74 years) in the indicated diagnostic quinquennium, the age-specific rates are summed, multiplied by 5, and divided by 1,000. This is a direct age standardization representing a population with equal numbers in each age group for every year. Day (111) explained the merits of this measure, one of which is that it approximates the cumulative risk.

The rates are tabulated with 1 decimal place. For more defined rates, the appropriate frequency and population group are available in other tables for the calculations.

Population Estimates

The midyear intercensal population estimates by sex and age used in the calculation of rates are for the resident population of Connecticut (*see* appendix tables II and III) and were produced by the Connecticut State Department of Health Services, Public Health (or Vital) Statistics Division. The basis of the estimates is the decennial count of the population by the United States Bureau of the Census. Therefore, we must acknowledge the influence of the differences from decade to decade in the methodology of taking the census, undercounting, and making the estimates. After each census, the Vital Statistics Division adjusted the annual postcensal population estimates for the previous decade (and the component towns) for the State. The new, intercensal estimates for the years 1940-70 have been published in the Connecticut *Registration Report of Births, Marriages, Divorces and Deaths* for 1951, 1958, and 1971 (116-118).

The annual postcensal age-sex estimates for the State have been published each year in the Registration Report (119). Until 1947, the estimates were made by the arithmetic method. For example, from the linear interpolations between the 1920 and 1930 census counts, constant yearly additive or subtractive amounts were calculated that were used for estimates of the postcensal figures for 1931

through 1940 for the State and its minor civil divisions, the 169 townships. This straight-line projection had given good results until 1940–45, when Connecticut experienced a large immigration due to its expanded war industries and a rapid rise in the birth rate. The population increase in the 1940s could not be estimated from the 1930–40 experience (120).

In 1947, statisticians at the State Department of Health Vital Statistics Division began using the component method to calculate postcensal estimates. The estimates were computed on a town by town basis, adjusting the decennial census counts with the combined effects of natural increase and net migration. Natural increase, the excess of birth over deaths, was determined from registered births and deaths, whereas net migration was estimated on the basis of observed changes in annual school enumeration. The proportionate change in the count of children aged 4 to 14 years to the number 5 to 15 years old a year later was applied to the total population (121). The population estimates for children up to 10 years old took into account the number of births in the preceding 10 years. For older ages, the statisticians used a cohort survival method to estimate the 1950 population by sex and age. Estimates for the intervening years were made by interpolation between the 1940 census and the estimates for 1950. These estimates were adjusted so that their sum equaled the total State population estimate obtained independently (120).

Postcensal population estimates by age and sex for the 1950s and 1960s were computed by application of life table survival rates to the population over 5 years old at the last census count. The number of survivors was adjusted to agree with the State's total population calculated by the component method. For those under 5 years, the population was estimated from births and deaths (118). After each census, the postcensal estimates by sex and age of the previous decade were revised so that the difference between the postcensal estimate and the actual census count was corrected. The difference was distributed over the intercensal period in proportion to the annual population change (Sullivan PD: Unpublished observations).

The postcensal estimates of the 1970s were computed by the component method as in the previous decade. The 1980 census revealed large discrepancies in the postcensal estimates of the late 1970s. A change in the migration pattern had weakened the effectiveness of the migration index based on the school census. The decreased birth rate exaggerated the weakness of the method. Therefore, a new series of intercensal population estimates by age and sex was calculated by a composite method rather than by proportionate revisions of the postcensal estimates. The population estimates for 1975 were based on trends in the Connecticut and United States mortality rates from 1960 to 1975. The 1975 estimates were then used for calculations of the populations in 1970–79. Populations for ages 0–29 years were estimated from the 1940–79 observed births; for ages 30–79 years, a cohort survival method was used and, for ages 80 and over, the populations were estimated by interpolation (Sullivan PD: Unpublished observations).

We used the 1971–79 intercensal estimates calculated by the composite method in calculating the incidence rates for that period in this monograph. However, the Connecticut Department of Health Services, Public Health Statistics Division, has chosen to use a series of estimates obtained from linear interpolation between the 1970 and 1980 census estimates. The discrepancies between the 1970–79 linear and composite method series average 2% but are 6% at the most. For 3 age groups in several years, the percent differences reached 10% or over. The estimates made by the composite method were selected because we found that when we trace the age group cohorts, these estimates better reflect the pattern of the natural decreases and drop in immigration that occurred in the Connecticut population (Schymura M: Unpublished observations).

Reliability of Registration: Percentage Tables

The completeness of case ascertainment and the quality of registration cannot be measured exactly. However for each site, 3 tables are presented that may be used as an indication of the reliability of registration in any period of diagnosis, sex, or age group. These tables indicate the percentages of cases confirmed histologically, registered from DCO, and diagnosed first at autopsy.

The format of these tables is similar to that of the 5-year incidence frequency tables. The percentages of the number of cases are given for each major primary site by sex. The primary site is identified by ICD-O title and number. The denominator consists of the number of cases shown on the 5-year frequency table, and the same specifications for selection of cases hold. The dash (—) signifies no cases in the denominator. A zero (0.0) value indicates that cases occur in this category (denominator), but none are in the numerator (e.g., as histologically verified cases).

Histologically Confirmed Cases

The diagnosis verified by histologic examination of the neoplastic tissue or cells is regarded with greater certainty than diagnosis by clinical means only. When the diagnosis has been assigned to a case after microscopic examination of the tissue, about 90% of such diagnoses are correct according to most pathologists (122). This criterion of the quality of cancer registration is also considered a measure of quality of patient care (123). Not only is the designation of cell type, malignancy, and differentiation considered to be probably more accurate, but the site of origin (124) and the extent of disease is as well. Microscopically confirmed cases include diagnoses based on specimens from biopsy, frozen section, surgery, autopsy, blood morphology in leukemia, bone marrow specimens, or dilation and curettage. Our tables also include cases confirmed with cytology, such as from sputum, spinal fluid, urine, or cervical smears. Cases stated as microscopically confirmed without giving the method are included in the percentage table (95).

Cancer at certain sites can be accurately diagnosed by an expert from an x-ray or endoscopic examination, and biochemical and immunologic tests are becoming more important as indicators of malignancy; nevertheless, the

experienced diagnostician also wants histologic verification. For example, one suspects that in the early years of registration, when diagnostic technology was less advanced and when abdominal surgery was related to a much higher fatality rate and thus not so readily undertaken, malignant tumors of the pancreas and stomach might have been mistaken for each other (125). The incidence of microscopically confirmed cases furnishes one assessment of the minimum frequency.

Death Certificate Only Cases

The DCO case was first registered from information on the death certificate: The patient either died of cancer or cancer was present, although death was attributed to another cause. When these certificates cannot be matched to cases registered from hospital admissions, with possible variations in spelling of names, birthdate, and other information taken into account, contact is made with the hospital where death occurred or with the certifying physician. The physician can often supply the needed information on diagnosis and treatment. Only those cases for which we cannot obtain additional information by follow-back (beyond that on the death certificate) are classified as DCO (22). The incidence tables include DCO cases, whereas the percentage tables indicate the proportion in each category known to the CTR only from the death certificates. The user may evaluate the relative completeness of registration and data quality for any site, sex, age, and year of diagnosis with this indicator.

Although case-finding from death certificates and follow-up on these cases does increase the completeness of registration, the inclusion of DCO cases in studies must be weighed (122, 123, 126). Both DCO cases and cases diagnosed first at autopsy are different from other incident cases for, presumably, they could have been diagnosed at an earlier date and might be considered prevalent cases (112). However, unless the proportion of DCO cases changes considerably, the errors balance (122). The DCO cases and cases that were diagnosed first at autopsy are excluded from some types of statistical analyses, such as survival, because of the paucity of information, and, in the CTR, they are termed "nonanalytic cases." In any study in which the nonanalytic cases are included, their possible influence must be considered.

Cases Diagnosed First at Autopsy

The percentages of the incident cases diagnosed first at autopsy are presented for each major primary site by sex, age, and year of diagnosis. As with DCO cases, the inclusion of those diagnosed at autopsy and their influence on the statistics should be recognized. These tumors have either presented no clinical symptoms or the symptoms were not recognized during the patient's lifetime. The date of diagnosis registered is the date of death for such cases.

The autopsy rate in a population and the extent and rigor of tissue examination during autopsies will affect the proportion of cases found at postmortem (112, 122). The importance of such cases in comparability of rates and the qualms over including them in incidence have been dis-

cussed (112). This issue caused particular concern with regard to prostate cancer because many occult cancers in older males are discovered at autopsy (127).

A decline in the number of autopsies performed first observed in the early 1970s has continued (128). Suggested reasons are that the cost of an autopsy became high and the Joint Commission on the Accreditation of Hospitals abolished the requirement for a minimum percent of autopsies in 1971. Many people with cancer who have never been hospitalized for this disease or for whom cancer had not been listed on the death certificate, i.e., persons whose cancer might have been discovered at autopsy, will not be registered.

Table Arrangement

Summary Tables

The initial tables summarize the data from the primary site tables of malignant neoplasms for all years 1935-79 or for the 5-year period or by age group. In these tables, the titles of sites are abbreviated titles for each ICD-O group.

The first table gives the total number of cases of both sexes at each site for all years and the number of cases excluded from that site as a special histologic type.

The second table presents the distribution frequency and percent of cases of malignant neoplasms by sex and period of diagnosis for all sites, 1935-79.

In table 3, the number, percent distribution by sex, and male-to-female ratio of malignant, in situ, and other selected cases are given by primary site for the total 1935-79 period.

The fourth table displays the malignant neoplasms by primary site and sex as a percent distribution of the total number for 1935-79.

Summaries of the data by primary site, sex, and both sexes for all years and quinquennia appear in the second set of tables (summary tables 5-12). In this format, tables are included for 1) frequencies, 2) average annual rates age-adjusted to the 1950 Standard Population, 3) to the 1970 Standard Population, 4) to the World Standard Population, 5) the cumulative rate, 6) the percentage histologically confirmed, 7) the percentage DCO, and 8) the percentage registered first at autopsy.

A third set of summary tables (summary tables 13-17) presents the primary site data for all years by age group: frequencies, crude and average annual age-specific rates, and the percentage tables of histologically confirmed, DCO, and autopsy-registered cases.

The data for "all sites, except nonmelanomatous skin" include only malignant neoplasms, although data for nonmalignant cases at 3 sites are displayed adjacent to the data for the malignant cases. In situ cases are not counted in the tabulation at "all sites."

Primary Site Tables

The data for the individual primary sites are presented as a group. For in situ cases, only frequencies are tabulated. Each table type gives the data by sex for all years and

quinquennia by age group as follows:

- A, B) Number of cases and median age
- C, D) Annual frequency
- E, F) Incidence rates: age-specific; crude; age-adjusted to 1950, 1970 United States, World Standard Populations; and cumulative
- G, H) Percentage of cases confirmed histologically
- I, J) Percentage of cases registered from DCO
- K, L) Percentage of cases registered first at autopsy

The tables of population estimates follow as appendix tables II and III: annual populations by sex and age group and 5-year sums of populations by sex and age. The Standard Populations are also given in appendix table I.

SPECIAL NOTES ON THE USE OF THE TABLES

The user of the tables should note that the following site tables are to be interpreted with caution. The section on classification gives helpful information; ICD-O code numbers are used.

All Sites: 144-199

Primary malignant neoplasms newly diagnosed in Connecticut residents from 1935 through 1979 are included. For details, *see* the section on Table Presentation; *see also* the classification lists for titles and codes. Nonmelanomatous skin cancer and *in situ* neoplasms have been excluded. The special histologies, *i.e.*, the lymphomas and leukemias, are included in the "all sites" category, but they are excluded from the individual anatomic sites and tabulated as separate titles.

Lip: 140

For this site, the researcher should be aware of several problems. It is often difficult for the clinician to determine the site of origin of the neoplasm when it occurs near the border between the vermilion border and skin or between the lip and oral mucosa, particularly when the neoplasm is large (92). Because skin cancers including malignant melanoma have been specifically excluded from the lip classification, CTR personnel have taken special care in coding this site. If the hospital or physician record did not state clearly the point of origin on the lip or used skin of lip, more specific information was sought. The term "lip" was coded to the lip category unless the histology of the tumor was basal cell carcinoma or basosquamous carcinoma, in which case it was coded to skin of lip, and therefore not included in this report. Other skin cancer histologies, such as squamous cell carcinoma, epithelioma, and epidermoid carcinoma, can occur on the mucous membrane of the lip and are coded to lip unless the record states that skin of lip is the primary site. The internal lip is included in the "lip" rubric.

Clinical determination of the point of origin is a challenge in all head and neck tumors. These cancers have been of special interest to a number of Connecticut physicians from the earliest registration period; the CTR staff has given special care to coding this site. As recently as

1977, the records were reviewed for recoding to the more specific subsite codes of the ICD-O.

Tongue: 141

Inasmuch as the tongue, like other oral sites, presents problems in the clinical assignment of point of origin or primary site, a great proportion of neoplasms has been classified as tongue, NOS. Lingual tonsil has been included with the tongue. So-called bookleaf neoplasm, which was located on both the tongue and floor of the mouth, has been assigned to floor of the mouth.

Major Salivary Glands: 142

Because salivary gland tumors tend to recur, the malignancy of a neoplasm may "be determined on behavior or presumed behavior rather than on cytological evidence," and "comparison of incidence rates between registries should be undertaken with caution" (92). The 1935-79 CTR data have been histologically verified in nearly 93% of the cases. Neoplasms of the minor salivary glands were assigned to the stated anatomical location or to the "oral cavity" [*see* (80), p. xviii]. They have not been assigned to the major salivary gland rubric. Mixed tumors of the salivary gland type have been reportable in Connecticut even when benign, but benign tumors have not been tabulated.

Gum and Mouth: 143-145

We chose this combination of rubrics because of the 1) difficulties in the clinical assignment of a tumor to a subsite in the mouth and 2) considerable overlapping in title and code content among the several codes used at the CTR over the years. Tabulations for several subsites of the gum and mouth are possible because of extensive reviewing and recoding of case records for gum, mouth, and buccal mucosa tumors. However, such tables would have to be interpreted with great caution due to several past coding changes (94).

Hypopharynx: 148

The problem of classifying and coding tumors of the aryepiglottic fold was reported by Muir (92) and MacLennan *et al.* (93). Some hypopharyngeal neoplasms are misassigned to the larynx because the reporting physicians used terms like "laryngopharynx" and "intrinsic or extrinsic larynx." The effect of these variations in reporting on time trends cannot be estimated easily. The lower rates before 1950 are probably due to the fact that there was no separate code for this region until that time.

Stomach: 151

When a tumor occurred at the gastroesophageal junction and was not specifically assigned to stomach or esophagus, it was coded to the esophagus if the histology was squamous carcinoma, and to the stomach if it was an adenocarcinoma (*see* the notes on Pancreas: 157). The problems of diagnosis and site assignment in the early years are revealed in the low percentages of cases micro-

scopically confirmed, 23% in 1935–39, 30% in 1945–49, but 91% in 1975–79.

Colon and Rectum: 153, 154

Colon and rectum have had discrete codes for all the years of the CTR. The colon subsites, however, must be used in the code combinations designated because of early coding practice. Note especially that ascending colon, cecum, and appendix are grouped.

The rectosigmoid junction has been coded with the rectum in the CTR.

Muir (92) and MacLennan et al. (93) emphasized that the assignment of location for a neoplasm in the sigmoid or rectosigmoid areas is difficult, and the terms may even be used incorrectly by the physician.

Carcinoid and argentaffin tumors of the appendix have been reportable since 1935 and were made reportable for the whole digestive tract in 1962. They were included in the tabulations only if graded as malignant.

Neoplasms of the skin of anus and perianal skin are excluded, but adenocarcinoma of the anus is included in 154. Although considerable reviewing of past records of anal tumors was done at the CTR, the user should be aware of the problem of differentiating anus and skin of anus cases in old records.

Liver and Intrahepatic Bile Ducts: 155

The coding rules for liver neoplasms may have affected the levels of incidence. Cases unspecified or unknown to be a primary liver tumor were not included with the liver rubric but were coded to unknown primary site 199. A review of a sample of Registry liver cancer cases done at the time of the introduction of the ICD-8 determined that less than 1% were actually neoplasms of the intrahepatic bile ducts (109). Changing diagnostic methods have been partly responsible for the accurate registration of these tumors. The percentage of histologically confirmed liver cancers has risen from 10.8% in 1935–39 to 85.0% in 1975–79.

Gallbladder and Extrahepatic Bile Ducts: 156

Note that the term “biliary tract NOS” is included in this rubric. Some pre-1950 cases, coded to the rubric of liver, gallbladder, bile ducts, and biliary tract, which were not separable upon review, may have been assigned to the biliary, NOS category.

Pancreas: 157

For neoplasms of the pancreas, the percentages of cases histologically confirmed and of DCO reveal the influence of changes in diagnostic methods. The percentage of cases registered DCO decreased from 49.1% in 1935–39 to 2.3% in 1970–74, but confirmation is still low. Microscopically confirmed cases in those same quinquennia went from 22.3% to 74.8%. Interpretation of time trends for this cancer should take into account the recognized potential for diagnostic confusion between stomach and pancreatic tumors.

The difficulties in the diagnosis of cancers of the pan-

creas and the late appearance of symptoms have caused problems in assignment of primary site. Gudjonsson et al. (125) have pointed out the high number of cases diagnosed as pancreatic cancer without good localization of the primary tumor.

Retroperitoneum and Peritoneum: 158; Other and Ill-defined Sites Within Digestive Organs and Peritoneum: 159

Tables for these sites are presented so that they may be available to the user who wants to combine all digestive sites. Before 1950, the 2 rubrics were combined but were reviewed and recoded as 2 categories in 1950. Cancerous ascites were included in the peritoneal rubric until 1968. As a result, the 1968 MOTNAC Task Force, which reviewed records in several large registries, revealed that 9% of peritoneal neoplasms were carcinoma incorrectly coded as primary (109). Record review was done at the CTR at that time.

Larynx: 161

See note on Hypopharynx: 148. Of all tumors of the larynx, 1935–79, 4.2% were in situ.

Trachea, Bronchus, and Lung: 162

The tables include the data for neoplasms of the trachea as well as the bronchus and lung because the code was combined until 1950 at the CTR. The coding rules indicate that a malignant neoplasm of the lung was coded as primary only if it was so specified. When not specified as primary, the neoplasm was considered metastatic and the case was coded to “unknown primary site.” Bronchial adenomas have been coded with lung since 1960. They have been considered malignant when grade was not mentioned since January 1964 (95).

In 1962, special codes were first used for neoplasms of the same type found in paired organs. In 1968, the coding rules stated that tumors of the same histology found in bilateral organs at the same time were coded as 1 tumor, and a special paired organ code flagged such a case. If the second tumor was found after 1 month, it was coded as a second primary (73). A separate code for multiple neoplasms in 1 organ flagged such cases (95). This change in coding practice may have increased the registered cases to a small degree.

Pleura: 163

This small pleural cancer data set has been included for the purpose of comparison with other data sets which combine this site with lung. In the CTR, it was given a unique code in 1950, and cases before that time were reviewed and recoded. During the field trials at several large registries by the 1968 MOTNAC Task Force, investigators found that 19% of pleural neoplasms had been incorrectly coded as primary, so a review was recommended (109) and conducted in the CTR. The increased awareness of mesothelioma in relation to asbestos exposure may have influenced the increased rate of diagnosis of pleural tumors after 1960. In Connecticut, 1935–77, 185 pleural tumors were registered of which 147 were mesothe-

liomas; autopsies were performed on only 39% of the deceased patients who had pleural tumors (129). A slide review of pleural tumors and mesotheliomas was made, and the results will be published (Vidone R, Teta MJ, Nowad LZ, et al: Unpublished observations).

Mediastinum, Heart, Other and Ill-defined Sites Within the Respiratory System, and Intrathoracic Organs: 164.1-165.9

Tables for these infrequent sites (237 cases) have been included in case the user wishes to combine all respiratory sites. Thymus neoplasms (164.0) have been tabulated separately so that they may be combined with endocrine neoplasms if desired. Neoplasms of the heart were coded as part of soft tissues of the trunk until 1968. If the case had not been recoded to mediastinum, it would not be included with this group of neoplasms in our tables. However, heart is a rare primary site for malignant neoplasms, representing only 1% of the tabulated soft tissue tumors listed in the Third National Cancer Survey (77).

Bones, Joints, and Articular Cartilage: 170

The coding of particular cartilage neoplasms is defined in the ICD-O. In general, neoplasms of cartilage of the trachea, larynx, nose, ear, and eyelid are not coded to 170 but to the anatomic site.

For primary bone neoplasms, we caution that some metastatic bone cancers were incorrectly included as primaries. In the first decade, only one-half of the diagnoses were confirmed microscopically. Among patients over 65 years old, the discrepancy in age-adjusted bone cancer rates for all cases versus those histologically verified is extremely large, a factor that adds to the suspicion that some secondary tumors may have been included (130).

The following histologic types are coded to bone even when the anatomic site is not designated or is a general term: osteosarcoma, Ewing's sarcoma, giant cell tumor, and osteoblastoma.

Connective, Subcutaneous, and Other Soft Tissue: 171

Neoplasms of connective, subcutaneous, and other soft tissues [including but not limited to muscle, blood vessels, connective tissue, adipose tissue, nerve, sympathetic and parasympathetic nervous system, peripheral nerves, bursa, synovia, tendon, etc.; (80)] are coded to the specific anatomic site if it is reported. Cartilage of the ear, however, is included in the connective tissue rubric (171.0). Soft tissue sarcomas such as leiomyosarcoma, rhabdomyosarcoma, myosarcoma, myoblastoma, liposarcoma, fibrosarcoma, synovial sarcoma, and hemangioendothelioma (M-912-916, 917), have been assigned to the appropriate soft tissue anatomic rubric, even when they were reported only at a general site, such as arm, shoulder, or buttock. When these sarcomas were reported without any site specified, they were assigned to "connective, subcutaneous and other soft tissues, NOS" (now 171.9). We included neoplasms of the peripheral and sympathetic nerves with the data for connective and soft tissues for all years of this report.

Uterus NOS, Corpus Uteri, Cervix Uteri: 179, 182, 180

Although the CTR has always had discrete codes for these sites, many neoplasms that were actually in the corpus uteri were designated only as "uterine," which meant that they were coded with "uterus, NOS." Endometrial tumors have been coded to corpus uteri consistently. Malignant change in uterine fibroid has been coded with chorionepithelioma in the placenta rubric from 1960 to 1975 (5 or 6 cases).

A special study (68) of the records of tumors of the uterus, NOS, diagnosed while the patients were alive, from 1935 to 1951, indicated that 90% of the tumors have their origin in the corpus uteri (131). Therefore, we also present tables combining cases of cancer of the corpus uteri with those identified as NOS. However, because of CTR rules, cases for which a more specific primary site (cervix or corpus uteri) was determined by this study could not be recoded without a pathologist corroborating the decision. The hysterectomy rate has also influenced incidence rates in this group (131, 132).

For neoplasms of the cervix in particular, it is important that other malignant cases be separated from in situ cases. Because of the differences in age distribution and the numbers which have increased with better diagnoses in the later decades, the inclusion of in situ cases with malignant cases would change the incidence patterns considerably (92). The incidence of in situ tumors of the cervix is tabulated separately. Of all cervix neoplasms, 1935-79, in situ tumors comprise 50.8%. In situ tumors comprise a significant proportion of all neoplasms of the vagina, 16.1%, and of the labia, clitoris, and vulva, 14.4%.

To be coded as an in situ case, a tumor must be histologically verified; this code is acceptable only if designated by a pathologist. If histologic confirmation is not available, the case is staged as localized (see "Selection of Cases").

Prostate: 185

The registered incidence of this cancer is known to be affected by the rate of autopsy. Small, clinically quiescent cancers have been reported as incidental findings at autopsy or in surgical specimens removed for other reasons in 14 to 46% of men over 50 years of age. Prostate cancer is thought to exist in two forms, the more common, localized form and a clinically aggressive disease (127, 133).

Urinary Bladder: 188.0-188.6, 188.8, 188.9

Tumors of the urachus (rare) are included with other urinary organs and are not included in our tabulations of bladder neoplasms because of past coding practices.

Both secular and international comparisons of bladder tumor incidence must be interpreted with caution due to differences in reporting rules, diagnostic criteria, and pathologists' terminology. For example, in Connecticut, papillomas have always been reportable and were actually coded as malignant until 1975.

The changes in coding over time reflect changes in the terminology used by Connecticut pathologists for the same type of tumor. Pathologists in this country have cus-

tomarily considered these low-grade, transitional cell tumors to be malignant, whereas European pathologists have traditionally considered the same lesions to be benign, unless clearly invasive.

These problems were pointed out at a 1961 symposium on cancer of the bladder. Dorn (134) stated that the reported frequency of cancer of the urinary bladder in human populations is affected not only by the difficulties of diagnosis common to all malignant neoplasms but also by the variation in concepts of how one can distinguish between malignant and benign papillary tumors. Indeed, some pathologists and urologists believe that it is meaningless to attempt to make a distinction, inasmuch as such a dichotomy cannot accurately characterize the underlying neoplastic process. It seemed to Dorn that the increase in incidence of bladder cancer rates in Connecticut in 1935-51 was likely due to more complete case-finding and reporting, more accurate diagnoses, and inclusion of benign papillomas, rather than a true increase in the incidence of malignant bladder tumors.

Mostofi (135) emphasized in 1960 the difficulties with the criteria for the diagnosis of cancer in bladder tumors and the lack of unanimity in using a standard pathologic classification. He repeated his plea in 1968 for cooperation in the development of a common understanding among pathologists of criteria for malignancy and of a standard nomenclature (136). Mostofi cited a survey of a large number of medical centers in which only one-third of the pathologists stated that they had made a diagnosis of papilloma of the bladder; two-thirds stated that they either diagnosed all papillary tumors as carcinoma or modified the term "papilloma" to indicate its unpredictable behavior.

Kidney and Other Urinary Organs: 189

Kidney, renal pelvis, and ureter are tabulated together because they were coded that way until 1968. The 1968 MOTNAC Task Force found that 60% could be designated as tumors of the kidney by histology. Review of the remaining 40% revealed that renal pelvis tumors comprised 30% and the 10% were probably ureteral (109). In a study of kidney cancer in the CTR 1935-73, we found that 76% were renal cell carcinomas and 23% were nonparenchymal tumors (137).

Brain, Cerebral Meninges, Cranial Nerves: 191.0-192.1

The grouping of brain, cerebral meninges, and cranial nerves for tabulation is necessary because of early coding practice. In the CTR, tumors of the optic nerve were classified with tumors of the eye and not with cranial nerve tumors until 1975. Sympathetic and parasympathetic nervous system tumors are included in our tables with soft tissue tumors (171) for all the years of this report.

Brain neoplasms present a difficult problem in diagnostic classification not only because of their inaccessibility but because the growth of benign tumors within the cranium will produce clinical symptoms similar to those of malignant histology. Some neoplasms metastatic from an undetected site may be included. Muir (92) suggested that all brain tumor data be combined. The user may do this

by adding to the sets classified as malignant those tabulated separately as neoplasm, brain, etc., benign or of unspecified or uncertain malignancy.

The histologic classifications of brain tumors reported by hospitals were not always made according to criteria standardized by neuropathologists. Furthermore, these criteria have changed over time.

Other and Unspecified Parts of Nervous System: 192.2-192.9

Tables for neoplasms of benign, unspecified, or uncertain malignancy for this site are included so that the user may combine the data with those of malignant neoplasms.

Thyroid Gland: 193

New diagnostic techniques and the increased aggressiveness with which nodules are checked by physicians add to the recognition of tumors that might have remained occult and unreported in earlier decades. Thyroid adenomas became reportable for cases diagnosed by January 1962 or later. Overdiagnosis of thyroid tumors as malignant has also occurred (124, 138).

Other Endocrine Glands: 194

Many problems are encountered in the classification of these tumors. Those in the cranial cavity create the same difficulties as other types of brain tumors. Other endocrine tumors, e.g., suprarenal, may be hard to reach surgically for either diagnosis or treatment. Many endocrine tumors can cause death even though they are not invasive. As a result, this title does not lend itself to epidemiologic analysis.

Hematopoietic and Reticuloendothelial Systems, Lymph Nodes: 169, 196

Malignant neoplasms of these sites are of special histologic types; therefore, they are tabulated as lymphomas and leukemias and not to any anatomic site. However, miscellaneous reticuloendothelial neoplasms M-971 and 972 (77 cases) have been tabulated with "other ill-defined and unknown primary sites."

Malignant Lymphomas: M-9590-9701, 9740-9750

The knowledge concerning these tumors has increased significantly over the 45 years comprising this report. The histologic classification of lymphomas has changed considerably over this period and is still much debated (139). New techniques in electron microscopy, cytochemistry, immunology, and enzyme markers have had an impact on the understanding of the biology of these neoplasms, their histopathologic diagnosis, and criteria for classification. Even though the lymphoma cases have been reviewed and recoded to newer codes many times in CTR history, we have grouped all the non-Hodgkin's lymphomas. Included are mycosis fungoides (139 cases); Sézary's disease; lymphomas, NOS or diffuse; lymphosarcomas; reticulosarcomas; nodular or follicular lymphomas; mast cell and Burkitt's lymphomas. Mycosis fungoides has been registered in the CTR since 1935, but the diagnostic accuracy of this entity is uncertain. Preliminary examinations of

non-Hodgkin's lymphoma trends in relation to several variables have led us to believe that CTR data do not provide a good basis for time-trend analysis. The data are included for completeness and for possible uses such as sex-ratio studies or time-limited comparisons with historical data from other sources.

Hodgkin's disease has been registered in the CTR from the start (49), and case records were reviewed several times for more specific classification. Neoplasms coded as Hodgkin's disease represent an entity appropriate for time-trend analyses.

Leukemia: 169: M-9800-9940

Since its inception, the CTR has registered leukemia with cancer. The medical knowledge of the disease and better discrimination among leukemia types have expanded over the years and led to an increasingly detailed classification of leukemia. With each major classification change, CTR did extensive reviewing and recoding of the leukemias. Nevertheless, certain titles and codes could not be separated from previous combined rubrics, and we urge caution in time-trend interpretation of the specific leukemia types which are tabulated. In the first CTR period, the only titles were acute leukemia, chronic leukemia, myelogenous leukemia, chronic lymphatic leukemia, and monocytic leukemia.

Polycythemia vera was included in the leukemia rubric from 1960 to 1975. In the 1968 CTR code, polycythemia vera had a unique code. The ICD-O classified it as a neoplasm of borderline or uncertain behavior (80). In manual review of the paper files for "other leukemia," the CTR staff reclassified some pre-1968 cases as polycythemia vera. We include separate tables for polycythemia vera for those investigators who wish to combine these data with those for leukemia.

Three additional tables have been included, grouping the leukemias into all 1) acute, 2) chronic, and 3) other types because of requests for these combined data.

We used the ICD-O titles in our tabulations. For example, lymphoid leukemia is the equivalent of lymphocytic leukemia in other nomenclatures. For granulocytic leukemia, the ICD-O uses myeloid leukemia. Basophilic and eosinophilic leukemia cases are included with other lymphoid leukemia in our tabulations because they were so grouped in the 1951 MOTNAC codes (70). Monocytic leukemia was not classified as acute and chronic at CTR until 1968, so we have not presented those subdivisions. Other leukemias include plasma cell leukemias, erythroleukemias, lymphosarcoma cell leukemia, and a miscellaneous group.

Nonmalignant and In Situ Neoplasms

For in situ neoplasms, only frequency tables are presented by sex, age group, and 5-year periods. The numbers and distribution of unreported cases cannot be estimated. The numbers of persons screened for in situ disease are unknown. Therefore, no rate calculations are appropriate for in situ cancers in Connecticut.

Neoplasms of the brain designated as benign, borderline, or not specified as malignant may have been diag-

nosed from behavioral symptoms only or by other non-surgical methods of diagnosis. Some may actually have been malignant types. Because of these problems of diagnosis, many investigators prefer to combine the data for all brain neoplasms. We include tables for tumors of benign, unspecified, or uncertain malignancy for the brain and for other nervous system tumors.

Polycythemia vera is not considered malignant in the ICD-O classification. Tables have been included; see the notes in the section on Leukemias.

An in situ neoplasm is classified as being of this behavior only when a pathologist has histologically verified it and assigned it this code. The CTR stage of disease code definition of in situ is "a tumor that fulfills all microscopic criteria for malignancy except invasion (confirmed by histology)." A case reported as carcinoma in situ of the cervix with microinvasion is coded as localized invasive cancer and is not included among the in situ cases. In many cases of in situ neoplasms, no clinical symptoms are apparent, whereas malignant neoplasms generally progress and eventually will produce symptoms. Therefore, most in situ tumors are found at screening or at examination for other conditions, and the numbers of cases diagnosed and registered most likely are a mix of incident and prevalent cases. The in situ cases were selected for inclusion both by the histologic behavior code and the CTR stage code.

SUMMARY TABLE 1.—*Number of primary neoplasms diagnosed in Connecticut residents, 1935–79*

ICD-O	Primary site	No. of tabulated cases	No. of cases excluded
140–172, 173:M-8720–8780, 174–199	Malignant neoplasms^{a, b}		
	All sites, except nonmelanomatous skin	316,000	0
140–149	Lip, oral cavity, and pharynx		
140.0–140.9	Lip	2,146	2
141.0–141.9	Tongue	2,434	11
142.0–142.9	Major salivary glands	928	61
143.0–145.9	Gum, floor of mouth, other and unspecified parts of mouth	3,373	23
146.0–146.9	Oropharynx	1,447	104
147.0–147.9	Nasopharynx	488	26
148.0–148.9	Hypopharynx	946	9
149.0, 149.1	Pharynx NOS, and Waldeyer's ring	364	3
149.8, 149.9	Other and ill-defined sites in lip, oral cavity, and pharynx	119	1
150–159	Digestive organs and peritoneum		
150.0–150.9	Esophagus	4,629	1
151.0–151.9	Stomach	17,958	309
152.0–152.9	Small intestine	863	143
153.0–153.9	Colon	35,688	69
153.0, 153.1, 153.7	Transverse colon, hepatic and splenic flexures of colon	6,192	7
153.2	Descending colon	3,011	1
153.3	Sigmoid colon	13,090	5
153.4–153.6	Ascending colon, cecum, appendix	10,262	53
153.8, 153.9	Colon NOS, and other sites	3,133	3
154.0–154.8	Rectum, rectosigmoid junction, anal canal, and anus NOS	19,185	19
155.0–155.1	Liver and intrahepatic bile ducts	2,158	5
156.0–156.9	Gallbladder and extrahepatic ducts	3,467	3
157.0–157.9	Pancreas	9,097	7
158.0–158.9	Retroperitoneum and peritoneum	651	173
159.0–159.9	Other and ill-defined sites within digestive organs and peritoneum	1,195	5
160–165	Respiratory system, intrathoracic organs		
160.0–160.9	Nasal cavities, accessory sinuses, middle ear, and inner ear	689	40
161.0–161.9	Larynx	4,403	11
162.0–162.9	Trachea, bronchus, and lung	31,017	75
163.0–163.9	Pleura	200	0
164.0	Thymus	84	4
164.1–164.9, 165.0–165.9	Mediastinum, heart, other and ill-defined sites within respiratory system and intrathoracic organs	237	92
169:M<959	Hematopoietic and reticuloendothelial systems	8	12,255
170.0–170.9	Bones, joints, and articular cartilage	1,049	72
171.0–171.9	Connective, subcutaneous, and other soft tissues	2,166	113
173.0–173.9:M-8720–8780	Malignant melanoma of skin	4,165	0
174.0–174.9	Female breast	44,189	40
175.9	Male breast	336	0
179–184	Female genital system		
179.9, 182.0–182.8	Uterus NOS, and corpus uteri	12,740	9
179.9	Uterus NOS	2,826	6
182.0–182.8	Corpus uteri	9,914	3
180.0–180.9	Cervix uteri	8,615	1
181.9	Placenta	51	0
183.0–183.9	Ovary, fallopian tubes, and broad ligament	8,267	7
183.0	Ovary	8,085	6
184.0–184.9	Other and unspecified female genital organs	1,446	3
184.0	Vagina	307	2
184.1–184.4	Labia, clitoris, and vulva	1,024	0
185–187	Male genital system		
185.9	Prostate gland	21,645	2
186.0, 186.9	Testis	1,392	27
187.1–187.9	Penis and other male genital organs	637	1
187.1–187.4	Penis	491	0

SUMMARY TABLE 1.—*Number of primary neoplasms diagnosed in Connecticut residents, 1935–79 (continued)*

ICD-O	Primary site	No. of tabulated cases	No. of cases excluded
188–189	Urinary system		
188.0–188.6, 188.8, 188.9	Urinary bladder	13,469	9
189.0–189.2	Kidney, renal pelvis, and ureter	6,437	10
188.7, 189.3–189.9	Urachus, urethra, other and unspecified urinary organs	223	0
190.0–190.9	Eye and lacrimal gland	7,722	32
191.0–191.9, 192.0, 192.1	Brain, cerebral meninges, and cranial nerves	4,697	21
192.2–192.9	Other and unspecified parts of nervous system	235	12
193–194	Endocrine glands (not thymus)		
193.9	Thyroid gland	2,489	29
194.0–194.9	Other endocrine glands	332	1
196:M<959	Lymph nodes	2	8,925
195.0–195.8, 199.9, M-9710–9722, (M-9950–9970)	Other ill-defined and unknown primary sites	13,990	28
M-9590–9970	Special histologic types^{b, c}		
M-9590–9701, 9740–9750	Lymphomas	10,671	
M-9650–9662	Hodgkin's disease	3,369	
M-9590–9642, 9690–9701, 9740–9750	Non-Hodgkin's lymphomas	7,302	
M-9730, 9731	Multiple myeloma (plasma cell myeloma)	2,677	
169:M-9800–9940	Leukemias	9,584	
169:M-9820–9825	Lymphoid leukemias	3,897	
169:M-9821	Acute lymphoid leukemia	1,146	
169:M-9823	Chronic lymphoid leukemia	2,100	
169:M-9820, 9822, 9824, 9825	Other and unspecified lymphoid leukemia	651	
169:M-9860–9866, 9870, 9880	Myeloid leukemias (granulocytic)	3,855	
169:M-9861	Acute myeloid leukemia	1,850	
169:M-9863	Chronic myeloid leukemia	1,165

SUMMARY TABLE 1.—*Number of primary neoplasms diagnosed in Connecticut residents, 1935-79 (continued)*

ICD-O	Primary site	No. of tabulated cases	No. of cases excluded
150-159	Digestive system	943	
150.0-150.9	Esophagus	17	
151.0-151.9	Stomach	37	
153.0-153.9	Colon	433	
154.0-154.8	Rectum, rectosigmoid junction, anal canal, and anus NOS	434	
160-165	Respiratory system	227	
161.0-161.9	Larynx	195	
162.0-162.9	Trachea, bronchus, and lung	26	
174.0-174.9	Female breast	694	
179-184	Female genital system	9,657	
179.9	Uterus NOS	2	
182.0-182.8	Corpus uteri	517	
180.0-180.9	Cervix uteri	8,899	
184.0	Vagina	59	
184.1-184.4	Labia, clitoris, and vulva	173	
185-187	Male genital system	136	
185.9	Prostate gland	109	
187.1-187.4	Penis	27	
188-189	Urinary system	241	
188.0, 188.6, 188.8, 188.9	Urinary bladder	185	

^a Special histologic types of neoplasms, M-9590-9970, are excluded from these sites.

^b In situ cases are excluded.

^c No special histologic types are excluded for the balance of this section of special histologic types.

^d No special histologic types are excluded for in situ neoplasms.

SUMMARY TABLE 2.—*Number and percent distribution of newly diagnosed cases of malignant neoplasms by period of diagnosis and sex, all sites, Connecticut, 1935-79^a*

Period	No.			Percent		
	Both	Male	Female	Both	Male	Female
All years	316,000	155,403	160,597	100.0	100.0	100.00
1935-39	15,958	7,052	8,906	5.1	4.5	5.5
1940-44	18,993	8,760	10,233	6.0	5.6	6.4
1945-49	23,507	11,200	12,307	7.4	7.2	7.7
1950-54	28,760	13,922	14,838	9.1	9.0	9.2
1955-59	34,290	17,231	17,059	10.9	11.1	10.6
1960-64	39,156	19,901	19,255	12.4	12.8	12.0
1965-69	44,672	22,555	22,117	14.1	14.5	13.8
1970-74	51,593	25,627	25,966	16.3	16.5	16.2
1975-79	59,071	29,155	29,916	18.7	18.8	18.6

^a All sites are included except nonmelanomatous skin and in situ neoplasms.

APPENDIX TABLE IV.—Primary-site groupings for incidence tabulations presented in the text-tables by the ICD-O codes, 1976

ICD-O	Primary site	ICD-O	Primary site
	Malignant neoplasms		
140-172, 173;M-8720-8780, 174-199	All sites, except nonmelanomatous skin	179-184	Female genital system
140-149	Lip, oral cavity, and pharynx	179.9, 182.0-182.8	Uterus NOS, and corpus uteri
140.0-140.9	Lip	179.9	Uterus NOS
141.0-141.9	Tongue	182.0-182.8	Corpus uteri
142.0-142.9	Major salivary glands	180.0-180.9	Cervix uteri
143.0-145.9	Gum, floor of mouth, other and unspecified parts of mouth	181.9	Placenta
146.0-146.9	Oropharynx	183.0-183.9	Ovary, fallopian tubes, and broad ligament
147.0-147.9	Nasopharynx	183.0	Ovary
148.0-148.9	Hypopharynx	184.0-184.9	Other and unspecified female genital organs
149.0, 149.1	Pharynx NOS, and Waldeyer's ring	184.0	Vagina
149.8, 149.9	Other and ill-defined sites within lip, oral cavity, and pharynx	184.1-184.4	Labia, clitoris, and vulva
150-159	Digestive organs and peritoneum	185-187	Male genital system
150.0-150.9	Esophagus	185.9	Prostate gland
151.0-151.9	Stomach	186.0, 186.9	Testis
152.0-152.9	Small intestine	187.1-187.9	Penis and other male genital organs
153.0-153.9	Colon	187.1-187.4	Penis
153.0, 153.1, 153.7	Transverse colon, hepatic and splenic flexures of colon	188-189	Urinary system
153.2	Descending colon	188.0-188.6, 188.8, 188.9	Urinary bladder
153.3	Sigmoid colon	189.0-189.2	Kidney, renal pelvis, and ureter
153.4-153.6	Ascending colon, cecum, and appendix	188.7, 189.3-189.9	Urachus, urethra, other and unspecified urinary organs
153.8, 153.9	Colon NOS, and other colon sites	190.0-190.9	Eye and lacrimal gland
154.0-154.8	Rectum, rectosigmoid junction, anal canal, and anus NOS	191.0-191.9, 192.0, 192.1	Brain, cerebral meninges, and cranial nerves
155.0-155.1	Liver and intrahepatic bile ducts	192.2-192.9	Other and unspecified parts of nervous system
156.0-156.9	Gallbladder and extrahepatic ducts	193-194	Endocrine glands (not thymus)
157.0-157.9	Pancreas	193.9	Thyroid gland
158.0-158.9	Retroperitoneum and peritoneum	194.0-194.9	Other endocrine glands
159.0-159.9	Other and ill-defined sites within digestive organs and peritoneum	196;M<959	Lymph nodes
160-165	Respiratory system, intrathoracic organs	195.0-195.8, 199.9, M-9710-9722, 9950-9970	Other ill-defined and unknown primary sites
160-160.9	Nasal cavities, accessory sinuses, middle ear, and inner ear	M-9590-9970	Special histologic types
161.0-161.9	Larynx	M-9590-9701, 9740-9750	Lymphomas
162.0-162.9	Trachea, bronchus, and lung	M-9650-9662	Hodgkin's disease
163.0-163.9	Pleura	M-9590-9642, 9690-9701, 9740-9750	Non-Hodgkin's lymphomas
164.0	Thymus	M-9730, 9731	Multiple myeloma (plasma cell myeloma)
164.1-164.9, 165.0-165.9	Mediastinum, heart, other and ill-defined sites within respiratory system and intrathoracic organs	169;M-9800-9940	Leukemias
169;M<959	Hematopoietic and reticuloendothelial systems	169;M-9820-9825	Lymphoid leukemias
170.0-170.9	Bones, joints, and articular cartilage	169;M-9821	Acute lymphoid leukemia
171.0-171.9	Connective, subcutaneous, and other soft tissues	169;M-9823	Chronic lymphoid leukemia
173.0-173.9; M-8720-8780	Malignant melanoma of skin	169;M-9820, 9822, 9824, 9825	Other and unspecified lymphoid leukemia
174.0-174.9	Female breast	169;M-9860-9866, 9870, 9880	Myeloid leukemias (granulocytic)
175.9	Male breast	169;M-9861	Acute myeloid leukemia
		169;M-9863	Chronic myeloid leukemia
		169;M-9860, 9862, 9864-9866, 9860, 9880	Other and unspecified myeloid leukemia

APPENDIX TABLE IV.—Primary-site groupings for incidence tabulations presented in the text tables by the ICD-O codes, 1976 (continued)

ICD-O	Primary site	ICD-O	Primary site
169:M-9890-9894	Monocytic leukemias		In situ neoplasms
169:M-9801	Acute leukemia NOS	140-172, 173:M-8720-8780, 174-199	All sites, except nonmelanomatous skin
169:M-9803	Chronic leukemia NOS	140-149	Lip, oral cavity, and pharynx
169:M-9800, 9802, 9804, 9810, 9830-9850, 9900-9940	Other and unspecified leukemias	140.0-140.9	Lip
		141.0-141.9	Tongue
		143.0-145.9	Gum, floor of mouth, other and unspecified parts of mouth
169:M-9801, 9821, 9841, 9861, 9866, 9891	All acute leukemias	150-159	Digestive system
		150.0-150.9	Esophagus
169:M-9803, 9823, 9842, 9863, 9893	All chronic leukemias	151.0-151.9	Stomach
		153.0-153.9	Colon
169:M-9800, 9802, 9804, 9810, 9820, 9822, 9824, 9825, 9830, 9840, 9850, 9860, 9862, 9864, 9865, 9870, 9880, 9890, 9892, 9894, 9900-9940	All other leukemias	154.0-154.8	Rectum, rectosigmoid junction, anal canal, and anus NOS
	Neoplasms of benign and uncertain malignancy	160-165	Respiratory system
		161.0-161.9	Larynx
169:M-9950/1	Polycythemia vera	162.0-162.9	Trachea, bronchus, and lung
191.0-192.1	Brain, cerebral meninges, and cranial nerves	174.0-174.9	Female breast
		179-184	Female genital system
192.2-192.9	Other and unspecified parts of nervous system	179.9	Uterus NOS
		182.0-182.8	Corpus uteri
		180.0-180.9	Cervix uteri
		184.0	Vagina
		184.1-184.4	Labia, clitoris, and vulva
		185-187	Male genital system
		185.9	Prostate gland
		187.1-187.4	Penis
		188-189	Urinary system
		188.0, 188.6, 188.8, 188.9	Urinary bladder
